Five commandments for value investors

It is not enough to just find companies that have low valuations

10

Worth its weight in gold

Why good corporate governance is a sensible starting point in creating value for shareholders

12 Opportunities in crisis

Portfolio managers buy when others are forced to sell

16 Behind the euro crisis

A new sovereign debt crisis is brewing in the shadow of the ongoing euro crisis **PORTFOLIO MANAGERS' REPORT PAGE 24:**

Synchronised markets

Rarely have so many asset classes fluctuated as much – and in such a coordinated manner. And never before have government finances in the euro countries received as much attention from investors. Emerging markets once again suffered the effects of the flight to safety, which made 2011 a poor year for us.

Year of unrest

2011 was dominated by dramatic events and a great deal of uncertainty. This had a negative impact on SKAGEN's funds, and SKAGEN Kon-Tiki was the only equity fund that outperformed its benchmark index. SKAGEN Tellus and SKAGEN Avkastning did not manage to deliver excess returns in a crisis-ridden fixed income and bond market.

SKAGEN VEKST

Manager: Beate Bredesen Start: 1 December 1993

Unless otherwise stated all figures quoted in this report are in euro, except for the Financial Statement and Notes, which are in Norwegian kroner.

SKAGEN Funds only has authorisation to market its money market funds SKAGEN Høyrente and SKAGEN Høyrente Institusjon in Norway and SKAGEN Krona in Sweden. Information regarding these funds is included in the official accounts and audited information hereto. Other information regarding these funds from the Norwegian version of the report has been excluded from this English language publication.

The Annual Report 2011 was originally prepared in Norwegian. This is a translated version that is published with reservations regarding possible errors and omissions as well as erroneous translation. In case of conflict between the Norwegian and the English versions, the Norwegian version shall prevail. The Norwegian version of the Annual Report 2011 is available at www.skagenfondene.no

ANNUAL REPORT 2011

SKAGEN Funds invests in Undervalued, Under-researched and Unpopular companies all over the world. SKAGEN AS was established in Stavanger in 1993 and is one of Norway's leading fund managers.

Postal address:

SKAGEN AS Postbox 160 4001 Stavanger, Norway

www.skagenfunds.com

Telephone no.: +47 51 21 38 58 Email: contact@skagenfunds.com.

Editorial team:

Parisa Lemaire, editor Tore Bang, technical editor Nick Henderson, journalist Trygve Meyer, journalist Ole-Christian Tronstad, journalist Margrethe Vika, journalist Christian Jessen, journalist Michael Metzler, journalist

SKAGEN seeks to the best of its ability to ensure that all information given in this report is correct, however, makes reservations regarding possible errors and omissions. Statements in the report reflect the portfolio managers' viewpoint at a given time, and this viewpoint may be changed without notice.

The report should not be perceived as an offer or recommendation to buy or sell financial instruments. SKAGEN does not assume responsibility for direct or indirect loss or expenses incurred through use or understanding of the report.

SKAGEN recommends that anyone wishing to invest in our funds contacts a qualified customer adviser by telephone on +47 51 21 38 58 or by email at contact@skagenfunds.com.

General commercial terms

SKAGEN has updated its general commercial terms. The new commercial terms are available on our web pages. Please contact our Customer Services department to have a copy of the commercial terms sent to you free of charge.

Invitation to electoral meeting for the mutual funds managed by SKAGEN

We would like to welcome unit holders in SKAGEN Funds to our electoral meeting which will be held at the Stavanger Concert Hall on Wednesday 29 February, from 6pm to 9pm. The electoral meeting will be broadcast live on our Norwegian-language website www. skagenfondene.no so that as many people as possible may follow the proceedings. Please note that the meeting will be held in Norwegian.

Agenda for the electoral meeting:

- 1. Election of chairperson and two unit holders to sign the minutes
- 2. Board of directors' annual report
- 3. Auditors' report
- 4. Election of one board member to the board of directors of SKAGEN AS
- 5. Election of one deputy member to the board of directors of SKAGEN AS
- 6. Election of a member of the nomination committee
- 7. Questions sent in by unit holders.

The board of directors proposes that Ola Lauritzen be elected to the nomination committee for a term up to 2015.

The nomination committee proposes that Yuhong Jin Hermansen be reelected as a unit holder-elected board member for a term up to 2014. The nomination committee further proposes that Martin Petersson be elected as a unit holder-elected deputy member for a term up to 2014.

Unit holders wishing to nominate other candidates as unit holder-elected board members or deputy members may submit their nominations to legal@skagenfunds.com by 22 February. Please attach a statement of the basis for nomination and the candidate's CV. The nomination committee's proposal and any other nominations will be published on www. skagenfunds.com on 23 February.

Unit holders in funds managed by SKAGEN may place an advance vote for candidates to the positions of unit holder-elected board member and unit holder-elected deputy memberbetween 23 and 27 February. Submit your vote by sending an email to legal@skagenfunds.com.

In the election, unit holders' votes are weighted in accordance with the value of units held. Unit holders may vote by proxy. An approved power of attorney form can be obtained by contacting customer services on +47 51 21 38 58. Please remember to bring identification and a certificate of incorporation if applicable.

A unit holder is entitled to submit questions for discussion at the electoral meeting. Such questions must be submitted in writing at least one week before the electoral meeting. With the exception of the elections, the electoral meeting cannot pass resolutions which are binding for the funds or the management company.

Funds discussion with Einar Lunde

After the formal part of the electoral meeting, Investment director Harald Espedal will talk about the outlook going forward. There will then be a discussion about the funds with the portfolio managers and Investment director Harald Espedal. Unit holders may ask questions either via sms or in person. The funds discussion will be led by the journalist Einar Lunde, previously long-time anchor on the Norwegian NRK news programme.

More information and a registration form can be obtained by contacting customer services on +47 51 21 38 58. The deadline for registration is 28 February. The meeting is open to everyone. Light refreshments will be served.

Best regards The Board of Directors of SKAGEN AS

Martin Gjelsvik Chairman of the Board of Directors

Strangely in step

2011 was the year in which financial markets focused on the major events in the world. We have to go back more than twenty years to find such high correlation in the stock market, as well as between companies and sectors. Stocks rose, and fell, more or less in step.

Some years the markets focus on companies and in others on macroeconomic conditions. 2011 was the second consecutive year dominated by economic issues and with less focus on our metier: Stockpicking based on companies' fundamentals.

We are not pleased with the overall performance in 2011, although there are bright spots in some funds and the long-term returns of the equity funds are good. SKAGEN Global and SKAGEN Vekst delivered both poor absolute returns and underperformed their respective benchmark indices. SKAGEN Kon-Tiki did better than its benchmark and has done so each year since it was launched in 2002. All of the fund returns in 2011 can be found on page 2.

The market focus changed during the year from the uprising and a shift of power in a number of Arabic and North African countries to the earthquake and tsunami in Japan. In the political arena, US politicians played to the gallery in the process of solving the country's economic problems. In Europe the euro crisis, unrest in European banks and an ongoing European recession dominated.

A waiting game

Equities in global emerging markets fell more than those in developed markets in 2011, partly due to a flight to perceived safer investments and countries. We believe, however, that over time the valuation of equities will come to reflect companies' fundamentals. SKAGEN's investment style involves going against major fashions and fads in the market and seeking out investments that are unpopular, undervalued and under-researched. We buy when we believe the discounts in a company to be good; preferring to be long term in outlook and waiting for triggers to be released.

We have been asked on more than one occasion during the year whether it pays off to be in the market when the returns are so poor. Looking back over the past decade, there have been major fluctuations in stock markets, and yet the rationale behind long-term equity investing continues to hold true. We own companies that over time deliver better returns on capital than one could hope to get risk-free in the bank.

Positive net subscriptions

Given the substantial uncertainty surrounding the markets in 2011, we were gratified that our clients remained calm amidst the market turbulence. We had positive net subscriptions of EUR 77 million. Our international markets - the Netherlands and Denmark in particular contributed significantly to this development. If we discount the Swedish pension agency, PPM, there were net subscriptions from Sweden in 2011, and we are satisfied with the fact that during the course of the year the Swedish authorities introduced measures to counteract the mass movements of clients' assets in PPM. In Norway, where SKAGEN is market leader, clients have remained fairly calm despite falling optimism about future prospects.

Clients naturally request more information when there is unrest in the markets. We have responded by increasing the frequency of commentary on our web pages, both in the form of written articles and short videos. We would like to thank all our clients who have participated actively by sending in questions and comments for our net meetings, SKAGEN TV broadcasts and in social media during the course of the year. This interaction enables us to provide answers on the issues clients are most concerned with.

Steady growth

The management company has grown steadily over the course of the year and we have recruited where necessary. The office in Amsterdam opened in September as planned, and three employees are already in place to provide good service and communication to our existing and future Dutch clients.

At the end of 2011 most of SKAGEN's client representatives in Norway are authorised financial advisors. In Sweden a similar authorisation scheme was introduced in 2005. Employees' competence and experience are important resources for creating good risk adjusted returns for clients as well as providing the best possible service, communication and follow-up.

Better overview over your portfolio

Timing is not something we claim to be particularly good at. During previous up and downturns in the market, we have seen that clients who buy near the top (when things are expensive) or sell near the bottom (when things are cheap) may not do as well relative to the fund's return. Regular saving and withdrawals can substantially reduce the risk of making poor purchases and sales.

SKAGEN's goal is to ensure that clients receive equally good returns as the funds they invest in. In 2011 we launched a new reporting tool to give clients a good overview of the units held in a fund, their portfolio composition, the value of the portfolio and returns in the period. The client portal, My Page, which is available on our web pages, provides an updated and tailored overview of clients' investments as well as money-weighted and time-weighted returns. Clients who remain in the market until it rebounds will surely benefit from the upswing.

At the start of January 2012, the equity funds' portfolios have low valuations at almost the same level as when the stock market bottomed out in the winters of 2002/03 and 2008/09. We have the patience to wait until the fundamental values are released.

Profile: Investment director Harald Espedal

One would imagine that being the Managing director of a company like SKAGEN was enough to keep him busy. However, as of 1 October, Harald Espedal assumed the additional role of Investment director, taking over from Kristian Falnes.

A steady increase in SKAGEN's assets under management and the growing size of the portfolio department mean that the management and administrative burden on the Investment director is greater too.

"Really talented portfolio managers don't grow on trees. It is better to allow them to concentrate on managing the funds and let others handle the management and administrative tasks," says Harald Espedal.

Espedal took over the position on 1 October 2011, having already assisted Falnes with his administrative duties for over a year.

"The most important thing is to ensure good analytical processes. This means each individual portfolio manager sharing his or her knowledge with the others. I also feel strongly about teamwork when deciding how to find the right investments in sectors and countries that match up with our investment philosophy. The accumulated knowledge of each portfolio manger must be shared," explains Espedal.

Portfolio manger

Despite his relatively young age, Espedal has a long history in the world of stocks and shares, both as portfolio manager and administrator.

"I have been following the stockmarkets closely since the 1980s. I became a portfolio manager in the 1990s and Managing director of SKAGEN in 2002," says Espedal. As Managing director he has followed the work of the portfolio department closely.

"I have been working with leadership since I joined SKAGEN ten years ago. In the time leading up to taking over the role as Investment director, I focused on being involved in the portfolio department and following the investment processes."

Managing director

"In the role of Investment director I am more a department head than a fund manager," replies Espedal when asked where he would place himself between these two extremes.

"As Investment director it is important to have a thorough understanding of the financial markets. But it is not my job to decide which investments should or should not be included in the funds' portfolios.

Harald Espedal: Managing director and Investment director

Professional experience:

- Joined SKAGEN in 2002
- Head of Andersen (now Ernst & Young) in Stavanger
- Investment director at Vesta
- Fund manager Europe at Skandia
- Head of Finance and Analysis, Sparebank 1 SR-bank
- Chairman of the board, Norwegian Mutual Fund Association
- Board member, Oslo Børs VPS Holding ASA and the Oslo Stock Exchange

That is up to the individual portfolio manager. My role is to lead the people employed in the portfolio department."

How has the transition been?

"I think it has gone very well. These are people I know very well and who work autonomously. However, they still need a department head, someone to make decisions and facilitate knowledge-sharing processes. The portfolio department consists of 18 people from a wide range of backgrounds, and I believe this is a great advantage. We need to make the most of this diversity and ensure that all voices are heard."

Harald Espedal took over as Investment director on 1 October. As Managing director and Investment director he strives to ensure good analytical processes and transfer of knowledge.

SKAGEN's International Strategy - Where are we?

If 2010 was the year of the London office, then 2011 was the turn of Amsterdam. We first gained marketing permission for our funds in the Netherlands in 2006. Over the intervening years we responded to local interest and cautiously built a client base amongst retail and high net worth investors. Such was our success that in September 2011 we opened the doors of our premises at Museumplein and started a new chapter in SKAGEN's international development. So where is SKAGEN's international client adventure right now, and how far are we prepared to go?

Why go international?

SKAGEN's modest international client growth seeks to support our ambition to deliver the best possible risk adjusted return to our investors. We have accessed new markets in order to diversify our client base. This diversity serves to reduce the volatility of client activity in the fund. And this in turn allows the portfolio managers to focus on investment decisions; rather than trading in order to manage client transactions. To date, this strategy works. Even during the challenging market conditions of 2008 and, lately, in 2011, SKAGEN has not been hit by the kind of large outflows that can badly damage fund returns. The strategy has so far seen SKAGEN obtain marketing permission in the Nordic countries, and then in the Netherlands, the UK, Luxembourg, and, most recently, in Switzerland and Italy (institutional investors only).

So how has the client experience differed during 2011 in SKAGEN's non-Nordic international market areas?

The Netherlands

Dutch investor activity in SKAGEN throughout

2011 has been pretty consistent, as it was during 2010. Our mainly retail and high net worth clients tend to be experienced investors. Their investment horizons chime well with those of our funds. We have seen a steady but manageable rise in managed assets during the year, to a total just under EUR 1 billion, thanks largely to the ambassador role played by our long-term partners in the Netherlands. It is this increase in client interest over the past few years that has demanded a branch office. We now have a local team in place in Amsterdam. Having been assimilated into the SKAGEN culture and customs, and having been educated on our funds and their investment portfolios, their task is now to support our many Dutch clients. This should allow us to better communicate with investors, and to provide advice and insight well suited to the needs and interests of our Netherlandsbased clients. It is important to record that our ambition for the Amsterdam team in 2012 is not asset growth; it is rather to demonstrably raise the frequency and quality of service that we can deliver to our local investors.

Great Britain

UK, by contrast, is primarily an institutional client base for SKAGEN, to the tune of just short of GBP 1 billion. Some 35 corporate and public pension schemes are currently invested with us. A number of these are (closed) defined benefit schemes, and we have therefore seen some derisking as the schemes mature. But all remain SKAGEN investors despite some taking some profit off the table during the year. We continue to see strong demand for our equity funds from such investors, and increasing interest from the public sector also. We have also diversified our client base over the past 18 months to include some London-based family offices. These are sophisticated and long-term investors and are a good fit with SKAGEN's long-term philosophy and value-based investment process. Ahead, we will soon dip a toe into the demanding UK retail market. We have seen real interest from a wide range of actors, including from a good number of our institutional investor trustees who wish to invest their own money alongside that of the pension schemes that they oversee - good alignment indeed. In the retail client segment we seek diversification, and knowledge; but we are cautious in our approach and our ambitions are modest. Selecting the right partners with which to work will be critical and we have spent this past year mapping and analysing the market. We are now ready to open this new channel subject to the final legal and operational technicalities being in order - and the announcement of this should follow on our website shortly.

Luxembourg

Luxembourg has long been known as an important centre for financial services. We have a good range of locally based investors, both private and professional. And we have a number of clients from other jurisdictions who route their investments with SKAGEN through Luxembourg. Investment patterns have largely matched market confidence over the year. Having previously adopted a very reactive approach to the market there, during 2012 we intend to establish closer links with our Luxembourgbased clients and partners. And we need to gain greater awareness of this important investor hub to ensure that our service and follow-up meet the best standards.

Switzerland

In 2011, SKAGEN gained permission from the Swiss regulator to market our funds to locally domiciled investors across all client segments.

This was, by necessity, a lengthy process, coming as it did alongside international discussions over tax and bank secrecy. The Swiss market is mature and complex, as one might expect given their private banking pedigree. In Switzerland good fund providers do not sell; investors buy. And the Ambassador approach to business development is much preferred. This suits SKAGEN very well. Already we have attracted a small but well diversified group of clients, from private banks to high net worth investors and family offices. We have made strides in identifying potential partners in most of the appropriate channels. And we have in place the essential infrastructure to make our funds visible and available to Swiss investors and compliant with Swiss Law. This year should see us working hard to set the bar high for client service and follow-up, despite supporting the market from our home town of Stavanger, Norway.

Italy

In addition this year has seen us receive permission to market our funds to institutional investors in Italy. Our intentions in this historic market are conservative also. Our light touch strategy is based on screening and information gathering while subscribing a limited number of professional clients through a local partner based in Milan. Our impressions so far suggest a relatively closed market; but one likely to be subject to seismic change. We have seen good interest from Italian investors the past few years and this explains our decision to support this in the same way that we have elsewhere. Whether or not an office might follow will depend principally upon the amount of investor activity that we attract. It is this client interest, and not a commercially-minded decision, that determines where we lay our hat.

Home market, or under home market supervisio

The international client base makes up some 20 percent of SKAGEN's investors by assets. This represents an important contribution to client diversification, and thereby to our delivery of the best risk adjusted returns to our investors. Our growth in these mature and demanding markets has been cautious and conservative. Diversification and knowledge remain our purpose; not asset growth for its own sake. We have learnt much from supporting investors beyond Scandinavia, and much of this we have recycled to the benefit of all our clients. There is, of course, interest from further afield. Australia, Hong Kong, Singapore and South Africa have seen notable investor activity in SKAGEN. But world domination is not on our

list of things to do. So 2012 will see us consolidating our European client base for the most part. And focussing on delivering the best risk adjusted returns for our unit holders, together with the best client service, communication and follow-up. It is likely to be a challenging and enjoyable year.

Five commandments for value investors

In order to succeed as value-based investors, it is not enough to just find companies that have low valuations based on earnings and book value.

The basic idea behind value investing was established by Benjamin Graham and David Dodd in the early 1930s. The concept was a simple one. By focusing on fundamental company analysis, investors can achieve good results in the stock market. The analysis essentially boiled down to finding companies that trade at a significant discount to earnings (P/E) and book value (P/B).

The philosophy developed by Graham and Dodd continues to provide a solid foundation in turbulent markets. The challenge for value investors, however, is that it is based on static valuation metrics. Companies' valuation metrics are analysed without taking into account the fact that companies are constantly growing and changing. For a long-term investor with a three to five year horizon, these changes often have a significant effect on a company's fundamental value.

In our experience, the key to long-term success lies in a combination of buying companies cheaply and being aware of what will influence them over time.

With this in mind, we will explore five central success criteria for an active, value-based equity investor such as SKAGEN.

First commandment: Avoid permanent losses

If you wish to earn money, a good starting point is to avoid losing it. From the perspective of a long-term value investor, it is important to differentiate between temporary and permanent loss of capital.

Temporary loss occurs when a stock falls in price even though there has been no change in the company's intrinsic value. Permanent loss occurs when a company's fundamental value changes because the future potential to earn money weakens.

Historically, there have been two main types of permanent loss for value-based investors. The first, and most important, is debt. In our experience, companies that take on a lot of leverage in order to earn money should be treated with a great deal of scepticism, banks included. This is because debt reduces the operational margin of safety and manoeuvrability. A poor business year, regardless of whether it is due to a weak real economy or other unforeseen circumstances, can easily result in a company being forced to raise new capital, or in the worst case going into liquidation. Both outcomes cause irreparable damage to shareholders.

A more silent predator is creative destruction; the inherent capitalist process whereby new and expensive products are replaced by better and/or cheaper ones, which causes a company's competitive advantage and profit to erode over time. As a consumer, you continuously get cheaper and better mobile phones and televisions, while non-competitive manufacturers perish.

A good example of this is the fact that of the 30 original companies in the US Dow Jones Index only two still exist in their original form. Capitalism is a capitalist's worst enemy.

Second commandment: Growth is our friend, when it is cheap

There is often an artificial divide between growth and value stocks. The fundamental value of a company is a function of future cash flow. The size of the cash flow is tied up with the expected growth in earnings. As growth is a component in the valuation of a company, the two are inseparable – both in practice and in theory.

MORE SOPHISTICATED MARKET PARTICIPANTS

The stock markets of today are populated with more sophisticated participants than was the case 80 years ago, in the time of Benjamin Graham and David Dodd. A growing number of computers and investors scan the global stock markets daily to find mispriced stocks. Over the past 20 years it has therefore become harder to find good investments based purely on static measures.

Nevertheless, the paradox inherent to the stock market is that collective long-termism and rationality are still on the wane.

Is SKAGEN's investment philosophy adapted to the fact that the stock markets are in a continuous state of flux? We think so. The art of investing lies in combining Graham and Dodd's static principles with a deep understanding of how changes in company dynamics create value for shareholders. As long as companies create values, and the markets continue to suffer from mood swings, this formula should continue to serve us well. History tells us that many investors are willing to pay an irrationally high price for expectations of future high growth. That is why we always treat expectations of future growth with a healthy dose of common sense and scepticism. Our willingness to pay for growth is dependent on the price of the company, and to what extent we can be sure that the future earnings growth can be estimated.

Despite our inherent scepticism, over time we have seen that growth in companies' earnings has been one of the most important drivers for returns in some of SKAGEN's biggest and best investments.

Samsung Electronics is a good example of how growth can continue to create value over time. When the company first entered the SKAGEN Global portfolio in December 1997, the value of the debt and equity traded at 5.6 times the cash flow (EV/EBITDA). Fourteen years on, the ratio is the same. During this period we, as shareholders, have been able to enjoy average annual returns of 28 percent, thanks to annual earnings growth of 25 percent.

Third commandment: Return on equity is a long-term investor's best friend

From a value investor's perspective, the twin brother of growth is the return a company achieves on its equity. Growth requires capital, and the return on this determines to what extent growth creates or destroys value.

It is difficult for a company to create value for owners – both with and without growth, if it cannot demonstrate solid return on equity. That is why in the long run it is almost impossible to attain a higher return on stocks than the return a company attains on its own equity.

The reason that we prefer Korean companies to their Japanese counterparts is mainly down to the fact that Koreans are considerably better at using return on equity to create growth.

Fourth commandment: Good management is better than bad

SKAGEN is wary about making good management the sole criterion for investing in a company. Nevertheless, the ability and willingness of management to create values are decisive to whether a company's intrinsic value is refined or is left to rust.

Naturally we appreciate managers who take care of shareholders' money in the best possible way by being focused on and good at operational management. Competent, financially oriented managers, who share value creation with shareholders by means of dividends, share buybacks and structural financial measures are also in the SKAGEN spirit.

We will not necessarily rule out investing in a company if its management has a poor history, or continues to struggle with a frayed reputa-

Growth is our friend, as can be seen from the case of Samsung Electronics. Thanks to steady annual earnings growth, the company has provided an average annual return of 28 percent since 1997.

tion. If we can see management changes on the horizon, which could act as a trigger on the share price, we may take an interest. This is also true if the intrinsic value is of such high quality that even catastrophic management would be hard pushed to destroy it. One example of the latter is Brazilian state-dominated energy company, Eletrobras, which is a relatively large holding in all three of our equity funds.

We have been taught a valuable lesson about the differences between good and bad management in the rig sector. In 2005-2006, our equity funds chose to invest in US company, Pride International (Pride). The company's rigs were at that time cheap relative to the assumed market value, but its management was poor.

At about the same time, SKAGEN Kon-Tiki bought shares in Norwegian rig company, Seadrill. Objectively speaking, Seadrill was the more expensive company based on price relative to the book value (P/B), but the management was substantially better at creating value for shareholders.

When Pride was acquired by its US competitor Ensco in 2011, calculations showed that since the end of 2005 we had only attained an accumulated return of 45 percent on our Pride shares. In the same period, the return from Seadrill was 458 percent!

Fifth commandment Dividends – yes please

In the long run most empirical data shows that companies' dividends account for around 50 percent of the returns one could expect to get in the stock market. Put simply, buying stocks that provide solid dividends takes us halfway to our goal of beating the market. As active managers, we favour securing such a good starting point. The fact that the effect of dividends is more apparent in the long term rather than the short term means that they are often undervalued by short term investors. This also goes part of the way to explaining why a number of academic studies show that stocks with high dividends yield higher returns than stocks with low or no dividends over time.

Beyond the purely financial effect of dividends, it is our experience that a solid, deeply rooted dividend policy is a good indication of a company's long-term health, and of the management's willingness to create value for shareholders. Moreover, dividends are a far better tool for rewarding shareholders than share repurchase programs. This is due to the fact that on the whole companies are not good at investing in their own shares. A recent study by management consulting firm, McKinsey, showed that in 77 percent of cases shareholders would be better rewarded by receiving quarterly dividends that they themselves can reinvest in the stock.

We saw a practical example of this during the financial crisis. When the fear set in, most share repurchase programs were cancelled, yet on the whole companies continued to pay dividends. Shareholders who continued to receive dividends could choose whether they wished to buy further cheap shares. Shareholders who experienced cancelled share repurchase programs missed out on this opportunity, however, as their money was stranded in the company's bank account.

Worth its weight in gold

For SKAGEN evaluating which principles a company is governed by, who the main owners are and how they influence company management, is natural and necessary preparation to making a good investment decision.

How the market values a company is affected by the way in which it is governed. Good governance lays the foundation for value creation and generally reduces the risk of accounting scandals and other infractions that can be so destructive to a company's share price.

A company's share price is influenced by how the market perceives its corporate governance. SKAGEN can reap rewards if we can find a company where the market's perception of corporate governance is worse than our own, and where we think there may be triggers that could reveal the company's value to a wider audience.

Not all Koreans are Japanese

Investors have viewed companies in the Korean stock market as being badly governed, which has resulted in a lower valuation. Parallels are often drawn with Japan where companies have generally created low return on capital and shareholders have traditionally had little power. There are several examples of the same in Korea, but there are also exceptions.

An old acquaintance of SKAGEN, Samsung Electronics, is cheap precisely because it is a Korean company. The market believes that the company's corporate governance is poor

WHAT IS CORPORATE GOVERNANCE?

The Norwegian Code of Practice for Corporate Governance is intended to strengthen confidence in companies and to enhance the greatest possible value creation over time in the best interests of shareholders, employees and other stakeholders.

Listed companies will be expected to practice corporate governance that regulates the division of roles between shareholders, board of directors and executive management beyond the requirements of the legislation.

The Code of Practice provides principles and guidelines in a number of significant areas which include: - Business, objectives and strategies

- Equity, dividend policy and capital increase
- Internal control

(Source: The Norwegian Code of Practice for Corporate Governance www.nues.no)

Gazprom is Russia's largest energy company, with the highest resource reserves. One of the main price triggers for Gazprom is improved corporate governance.

because the company prioritises reinvestments over dividends. However, Samsung Electronics has created outstanding returns on its investments and thereby considerable value for its shareholders.

Invests when others are broke

One of the secrets of Samsung Electronics' success is its conservative capital structure. The company is in the unique position of being able to sustain or increase its investments in periods in which its competitors are under financial pressure.

This has contributed to Samsung Electronics becoming a world leader in production and sales of memory technology to the computer, cell phone and electronics industries, with an accompanying high return on its capital. The company's investments in consumer electronics are also developing, not least for smart phones where the company's market share is increasing at a fast and profitable rate. The key to the high return on the equity funds' investments in Samsung Electronics over the past 14 years has been buying the underlying value creation at an attractive price. This has been possible because the market has consistently overrated the risk of the company's management not acting in shareholders' best interests.

It is the direction that counts

Good corporate governance is a good starting point for creating value for shareholders. The challenge is that it is often relatively obvious which companies treat their shareholders well – and which do not – and this is factored into the share price. It is therefore more important to examine the future direction of a company's corporate governance than its current conduct. If the development is better than the market expects it will have a positive effect on the share price. And vice versa. In cases of poor corporate governance, only a slight improvement

Samsung Electronics is experiencing strong growth, partly from the production of the smartphone Samsung Galaxy. A key to the company's success is its ability to increase investments while its competitors are under financial pressure.

may result in a relatively large lift to the share price. Before SKAGEN invests in a company, we analyse the expected corporate governance and make an independent evaluation of whether it is likely that the company will in fact realise its plans.

Gazprom – risk or opportunity?

All SKAGEN's equity funds have invested in Russian Gazprom. The company is the world's largest gas producer and owns ten percent of the world's gas reserves. In addition, Gazprom is Russia's largest electricity producer and the fifth largest producer of oil. The company controls the country's network of gas pipelines and has significant storage capacity.

In spite of Gazprom being one of the few large, global companies with organic earnings growth over the next few years, the company's market value only equals three years' earnings. The company's oil and gas reserves are priced at around 20 percent of the value of comparable global companies' reserves.

Had Gazprom not been owned by the state, the company would probably be priced as the

world's most valuable company. Russia is notorious for corrupt politicians, and the state as a dominant owner has shown that it prioritises investments with a low return over dividends to its shareholders.

On the right track

The gas prices in Russia are currently well below market price. In addition to rising gas prices, SKAGEN believes that improved corporate governance could lead to a higher valuation for Gazprom. Since 2010 the company has been on the right track.

There are clear signs that the Russian government is pressuring state-dominated companies in order to receive a bigger share of the value creation to facilitate increased public spending. We expect this process to continue with the result that Gazprom will administer its capital better in the future, and that stock markets will revalue its highly undervalued assets.

GOOD GOVERNANCE OF CAPITAL STRUCTURE

Corporate governance creates a good foundation for a company's operations and can also influence whether and how investors receive returns on their investments.

Corporate governance also includes adopting a dividend policy that provides the best possible value creation for shareholders. A good dividend policy will ensure that a company reinvests its profits in new projects as long as these projects provide higher returns than the investors can achieve through alternative investments. If there are no good projects for the company to invest in, the profit is paid to the investors in the form of dividends.

If a company's corporate governance is poor, the risk is that the profit may remain in the company at a low rate of return. The reason may be the management's or largest owners' reluctance to pay dividends, a reluctance to invest or poor project management so that the company's investments do not provide good returns.

Buy when others are forced to sell

When others are hitting the sell button in low valuation markets, SKAGEN's independentthinking portfolio managers are able to make potentially lucrative investments.

This is an element of SKAGEN's doctrine that is highly relevant in the current investment environment; after a miserable year for stocks in 2011, companies now generally have low valuations based on their earnings and book values.

SKAGEN has been in existence since December 1993. Although this is a short period relatively speaking, it is long enough for us to have gained some hard won experience. It has been during times of market crisis that we have been able to pick up really cheap companies. Since SKAGEN's inception we have been through the Asia crisis in 1997, the Russia crisis in 1998, the bursting of the dot-com bubble in 2000-2002, the financial crisis in 2008 and the sovereign debt crisis in 2011.

"A characteristic of a financial crisis, such as the one that started in the autumn of 2011, is that there are a lot of forced sellers in the stock market, for example large institutions which due to their liabilities cannot handle large short-term losses. This results in low liquidity and irrationally low valuations – and consequently long-term opportunities for investors like us," says portfolio manager Kristoffer Stensrud.

The portfolio managers Kristoffer Stensrud and Kristian Falnes have the longest track record with SKAGEN's equity funds. This article discusses some of the successful investments SKAGEN has made during previous stock market troughs.

Rising from the ashes

A brief look at SKAGEN's history shows that the funds have generally enjoyed considerable success in periods of recovery after a crisis, and that these periods have contributed substantially to the funds' high returns over time. In 2003 the equity funds rose between 41 and 76 percent, in 2009 between 49 and 92 percent, measured in euro.

If one examines the underlying companies in SKAGEN's portfolios, we have not necessarily been invested exactly when share prices have gone from rock bottom to new highs after a crisis.

"In the autumn of 1998 our two equity funds at the time held large investments in a few Danish and Greek shares. Neither of these areas was affected by the crisis, though Greece developed into its own overvalued bubble in 1999 when the Greeks squeezed into the eurozone. We benefitted greatly from that," says Kristian Falnes.

"As portfolio managers we aim to spread the funds' investments and select viable companies we can own for years. Even though we emphasize the opportunities that can be found in a crisis, we do not constantly run around between the world's crisis centres looking for bargains," he adds.

In general the funds' returns have not been created by investing in the epicentres of finan-

cial crises. Rather, each individual financial crisis has had a global effect which has provided opportunities in all markets.

Gloomy market reports

For portfolio managers and unit holders alike, financial crises always make for a bumpy ride.

In August 1998, when the Russian crisis burgeoned, the funds lost about 15 percent of their value almost in an instant. Then as now, the portfolio managers adhered to SKAGEN's investment philosophy. They summarised the situation during the crisis in 1998 as follows:

"Our core belief is that it is impossible to predict the rise and fall of the market, but that companies' results, growth and an essentially level-headed assessment over time will provide good returns. These investment opportunities can most easily be found in the weakest stock markets. However, they also represent the highest potential for losses unless sufficient attention is given to spreading risk and quality control."

At that time in 1998, the largest challenges were being faced in Asia and Russia, so-called emerging markets, while this time around in 2011 it is Europe which is in the eye of the storm. Nevertheless, the assessment continues to hold true today.

Portfolio manager, Kristian Falnes

Extremely low confidence

Compared with the broader stock markets, our equity funds weathered the drawn-out stock market decline from 2000 to 2002 extremely well, but they were still the worse for wear once the three hard years were at an end. In November 2002, the portfolio managers took stock and predicted a brighter future ahead.

"There was extremely low confidence in shares and the global stock markets as an asset class were at rock bottom in 2002. That was the backdrop when we launched SKAGEN Kon-Tiki. Shipping, in particular, was in a squeeze after delivering low returns on capital for 20 years," Kristoffer Stensrud remembers.

"China's membership of the World Trade Organisation in 2001 changed the global trade landscape permanently, and led to a gigantic shipping boom. The signs were already clear, and in 2003 the returns were enormous," he adds.

The portfolio managers now look forward to Russia's membership of the World Trade Organisation kick-starting trade and investments, perhaps not to the same world-changing degree as China's did, but there will still be a positive effect.

Russian return

The worst financial crisis in the post-war era was at its height in 2008 and the first two months of 2009. For most of our clients the run-up to this crisis is easier to remember than that of 1998 and 2000.

SKAGEN's equity funds adhered to our investment philosophy in 2008 without increasing turnover, and went through some tough times as a result. Relatively speaking it was an advantage not to be heavily invested in disastrous financial shares, but emerging markets performed a lot worse than the US and Japan, both in terms of shares and currencies.

In 2009, when stock markets generally and Russia in particular were floored, we were able to invest in the Russian mobile and consumer staple sectors at literally rock bottom and three mobile phone operators entered the portfolios. In relative terms Vimpelcom and MTS were the best performers, but SKAGEN Kon-Tiki's NOK one billion profit in the mobile conglomerate Sistema was the most visible. In the consumer staple sector the funds invested in X5, Magnit and Efes Breweries.

"Russia got the worst beating but without reason. It was the dominating billionaires, the oligarchs, who were in trouble, not the state. All credit dried up and there was a mass liquidation of Russian assets. We considered the potential to be greater than the financial risk," says Kristoffer Stensrud.

Still annoyed

Despite broad global mandates, SKAGEN's funds can only be invested in a small percentage of the world's 60,000 listed companies. Possibilities will pass us by and we will inevitably have to take some losses. SKAGEN's clients are aware that it is a rare thing to keep getting it right over a long time period as we have done with our investment in Samsung Electronics since 1997.

Conversely, one of the most frustrating experiences for a portfolio manager is having been on the right track without having invested.

"We examined the Apple investment case closely in 2002, back when they were quietly building their empire and had launched the iPod. The technology sector was extremely unpopular so the company was cheap. We didn't see the new trend; that Apple would conquer the retail space with the iPhone in 2007, and we underestimated them in the same way many others did. Since then the share price has risen from USD 10 to 400 and Apple has become the world's most highly valued company," says Kristoffer Stensrud. This still annoys him, ten years later, but then again, no one can hit the bull's eye every time.

Potential high-fliers

As we enter 2012, which companies in the portfolios do the portfolio managers believe may distinguish themselves after the current crisis abates? Gazprom, Renault, China Mobile and Bharti Airtel stand out as potential highfliers.

Portfolio manager, Kristoffer Stensrud

"One gets access to the core business in Renault for less than nothing at the moment. The value of the company's shareholdings in Nissan, amongst others, is clearly greater than the value of the company as a whole. Renault has a weak local market in southern Europe, but is growing in emerging markets and is no longer under financial stress. We have benefitted from an upturn in Renault once before and expect to do so again," says Kristian Falnes.

"Four years ago Gazprom was extremely popular among investors due to its unique resource base. Since then the company has improved utilisation of its assets through, amongst other things, sales to China. However, while fears of mismanagement have been spreading, there are actually signs of improvement now, for example in the form of increasing dividends," says Kristoffer Stensrud.

"Both China Mobile and Bharti Airtel are well positioned to bring internet and mobile communication to the masses in Asia, India and Africa. We have only seen the tip of the iceberg here," he adds.

Roller Coaster Markets Risks and Rewards

Despite its sometimes sudden movements, many economists believe that stock markets are always right and that it is impossible for investors to beat the market. Others believe that markets can get it wrong and that it is entirely possible to beat them.

"Frustrating," is how portfolio manager Torkell Eide described stock markets in Norwegian magazine Kapital in October 2011. He was referring to the high market correlation, or in other words the phenomenon where stock prices move together as a group, based on economic unrest rather than fundamentals.

In these circumstances it seems that whether a company delivers good results or not has little or no bearing on its stock price in the short-term. In general a period of high correlation may be a difficult time for stock pickers such as SKAGEN, which selects stocks based on a company's individual merits.

On the other hand, irrational markets can provide buying opportunities – investments that will yield gains when market correlation subsides and companies are yet again priced according to their merits.

Terrance Odean, Professor of Finance specialising in behavioural finance, said in an interview with SKAGEN that he is not surprised that markets act irrationally.

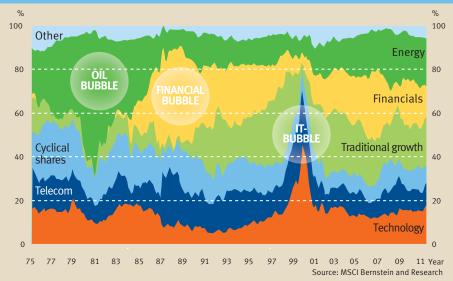

Behavioural finance teaches us that human psychology influences stock markets. Why, then, are we not seeing more proof of rational market behaviour?

"If investors, as a group, had quickly learned from their own and other people's mistakes they would have been exceptional in human history, which they are not. I suspect that the majority of investors who read my research, which shows that investors trade too frequently, think that this pertains to everyone else and not them," explains Odean.

Herd mentality

Terrance Odean believes that markets with high

GLOBAL SECTOR BALANCE

The development of the largest global listed companies (Mega-Cap Universe) from 1975 until the end of 2011 shows that there have been bubbles in various sectors.

correlation demonstrate the effect of human psychology and herd mentality, which again limits investors' gains.

SKAGEN works hard to avoid herd mentality by assiduously applying its investment philosophy. We therefore seek companies that are unpopular, under-researched and undervalued – in other words we swim against the tide.

It will not be news to anyone that the economy fluctuates. Stock markets fluctuate rapidly too, something that has been very visible since the start of the financial crisis in 2008. Are these sudden fluctuations warranted?

Put simply, share prices are based on the expectation of companies' future earnings.

With increasing profits and no clouds on the horizon, stock prices should increase. If the economy hits a soft spot, so too do expectations of future company earnings and stock markets will typically follow suit.

It is clear that from time to time the stock market does not price shares in a way that we believe is correct. This is evident when looking at the historic sector balances for global companies in the graph below.

The graph shows several bubbles in different sectors. The most recent was the so-called dot-com bubble around the turn of the millennium. Bubbles are formed when the pricing of a sector does not correspond with the value creation the sector is able to deliver over time.

Behavioural theorists believe that humans have a tendency to think that trends lasting for a long time will also continue in the future, or more simply explained, that rising stock prices will continue forever and investors often invest on the back of this belief. This may boost stock prices further, which in turn makes more people get caught up in the self-propelling trend of increasingly higher prices. Under extreme conditions this will create bubbles that are detached from all rational thinking and value creation. The opposite will happen when the bubble bursts. Again, investors will follow the trend of falling stock prices until the drop becomes exacerbated. The pricing of stocks are once more detached from their underlying value creation and are governed by anxiety of further declines and larger losses.

Have markets then not become more rational in the past 25 years of behavioural finance?

"I don't think people's psychology has changed much in 25 years. Still, institutional investors are noticeably more sophisticated now," says Terrance Odean.

He mentions two areas where technical changes have increased the likelihood of sudden market shifts, without any thought for fundamentals:

- Computer-based trading strategies may have been behind the types of stock market crashes witnessed in October 1987 or on 6 May 2010.
- Correlated trading strategies made highly leveraged hedge funds unable to survive because of poor liquidity in August 2007. The drop did not seem to stem from fundamental reasons.

Luck or skill?

Supporters of the theory of rational markets continue to believe that markets are 'informationally efficient', and that which breaks from the rational is simply dismissed as abnormal. The extension of a rational market is that all news spreads equally and efficiently, and it is not possible to make better or more informed decisions than those others are able to make.

There are without doubt investors who have been able to beat the market over time. How can this then be explained by the supporters of the efficient market theory? It is all down to luck, claimed Professor of Economics, Harry Flam on the Swedish television program "Oppdrag Granskning" in January 2008.

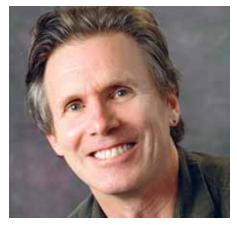

Harry Flam was interviewed for SKAGEN's Swedish Market Report in 2009 and he was asked how long it takes before one can dismiss luck as a factor when explaining how a fund manager has managed to beat the index.

"Generally six years, or in other words, it would be impossible to beat a market for seven years running purely because of luck," he stated. "The research has so far not been able to answer why some investors manage to beat the market for a longer period of time," the professor added.

One such example close to home is our emerging market fund SKAGEN Kon-Tiki, which has successfully beaten its benchmark every year since its inception in 2002. Incidentally, Kristoffer Stensrud, who is part of the SKAGEN Kon-Tiki team, has beaten the index for all the funds he has managed since the start of SKAGEN AS in 1993.

Super investor Warren Buffett is another example of someone who has been able to create excess value over time. Terrance Odean's

Terrance Odean is professor of banking and finance at the Haas School of Business, University of California, Berkeley. He is known for his work on behavioural finance.

favourite Warren Buffet quote about efficient markets is: "I'd be a bum on the street with a tin cup if the markets were always efficient."

It is also noteworthy that in 2011 Warren Buffett's Berkshire Hathaway failed to beat the Standard & Poor 500 index for a second time since 1990. 2011 was also the year when SKAGEN Global underperformed its benchmark index for the second time since 1997.

Better than average

Looking at the graph of historic bubbles again, we can see that the bubble at the end of the 1990s first swept through American blue chip companies and then information technology stocks. It then took twelve years for stock markets to adjust back to more 'normal' and attractive levels.

For the lemmings out there, the MSCI World Index has returned a total of 19 percent since August 1997, measured in euro. Over the same period SKAGEN Global has delivered a total return of 696 percent as of the end of 2011.

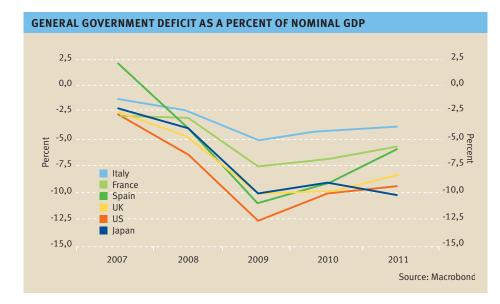

The SKAGEN portfolio managers and investors like Warren Buffet may to some extent thank the market for their returns, especially the market's lack of ability to price shares correctly at certain times. If markets continue to behave irrationally from time to time, this is certainly something SKAGEN will continue to exploit.

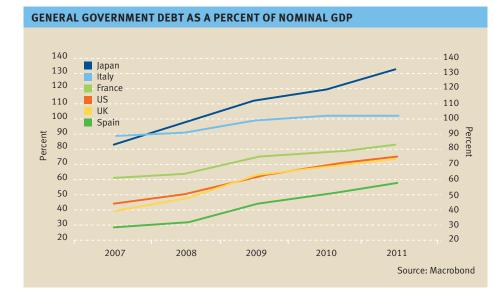

The Shadow Sovereign Debt Crisis

In the shadow of the eurozone turmoil, other public debt crises are looming. The public finances of some of the large, advanced economies are in worse shape than those of most of the stressed eurozone economies. We cannot exclude the possibility, therefore, that a debt crisis in an advanced economy outside of the eurozone periphery will soon dominate headlines. Such a debt crisis will manifest itself in what is called "fiscal inflation".

Poor public finances are not just a peripheral eurozone phenomenon. The public-debt-to-GDP ratio is much higher in Japan than Italy, for example. Also, the UK's public debt and public deficits are higher than those of Spain, and the US' fiscal stance is weakening faster than that of France (see charts). The hazards of sharing a common currency A debt crisis outside the eurozone periphery will take on a different form than that which has been experienced by the afflicted euro countries. Rather than spiralling credit risk, there will be spiralling inflation. The explanation for the divergent outcomes lies in how the

situation within the eurozone differs from that of those advanced economies outside it. Within the eurozone, member states do not have their own currency. The implication is that their sovereign debt behaves as if it were borrowed in a foreign currency. Eurozone governments do not have an independent national central bank that can "print" money and buy up their debt. Consequently, if a government is fiscally stressed, investors might legitimately start to worry whether they will get 100 eurocents back on each euro lent. Higher credit risk then leads to sharply higher interest rates. The situation is comparable to that of emerging market governments that have issued their debt in USD.

The merits of printing your own money

This contrasts with Japan, the UK and the US which borrow in their own currency. This makes a huge difference. Since their central banks are their lenders of last resort, they can, if necessary, "print" money and pay back the public debt. In other words, the debt can be monetized.

While a sovereign with its own currency is able to honour its debt, there is no guarantee that lenders will get their money's worth back in real terms. Therefore, instead of credit risk, public debt issued in the sovereign's own currency has inflation risk.

Crucially, while the reason inflation might flare up is the fact that the public debt might be monetized, inflation could start to rise well ahead of any explicit monetization. The very fact of investors thinking that sovereign finances are unsustainable would be enough to trigger higher inflation.

Whether public finances in Japan, the UK and the US are sustainable is debatable. Nevertheless, we should at least prepare for the possibility of "fiscal inflation" in these countries.

"Fiscal inflation"

We tend to think of inflation as a central bank phenomenon. Inflation overshoots the target if the policy rate is too low, and vice versa. This garden-variety inflation can be called "monetary inflation". Fiscal inflation, on the other

hand, is caused by too much public debt. How? The value of the public debt is backed by investors' expectations of future surpluses – just as stock prices depend on future profits. This means that if investors come to doubt that sufficient surpluses will be forthcoming to pay off the debt, the value of the debt falls.

How does the value of the debt fall? Assume that public debt has short maturity. Then its value falls through a jump in the price level, i.e. through a higher consumer price index. As the price level climbs, the purchasing power of money falls. Thus the real value of the public debt plunges. If the debt has longer maturity, its value drops both through lower bond prices and gradually higher consumer prices, i.e. higher inflation. The longer the maturity of the debt, the further inflation is pushed out in time. The end result is the same, though – creditors get all their money back, but fiscal inflation erodes its purchasing power.

The eurozone is not immune

Note that the eurozone as a whole could also experience fiscal inflation. What if the debt crisis were to spread from the periphery to the core, i.e. Germany, for example, through large fiscal transfers? It is unlikely that investors would attach credit risk to Berlin. Instead markets would assume that Frankfurt would eventually print the necessary euros. This means, however, that instead of credit spreads in the core, one would face uncomfortably high inflation in the eurozone as a whole.

A repeat of the Seventies?

Double-digit inflation in the 1970s was most likely "fiscal" in nature. Mushrooming welfare state programs coupled with limited public revenues caused investors to think that current deficits would not be matched by future surpluses. Inflation then spiralled until the real value of the public debt became sustainable.

Fiscal inflation is seldom stimulatory to the economy. Quite the reverse in fact. The 1970s were plagued by stagflation, that is, high inflation and recession. Economists who talk as if somewhat higher inflation could cure our economic woes should be careful what they wish for.

Impotent central banks

Central banks are powerless in the face of fiscal inflation. If the price level were to accelerate due to a breakdown of trust in public finances, they would most likely react by hiking the policy rate. If there were no change in the fiscal policies, however, a higher policy rate would fuel inflation. Why? With a higher policy rate, the government has to pay higher interest expenses when it rolls over its debt.

Averting fiscal inflation

Governments have the power to suppress, or avert, fiscal inflation by pursuing a prudent fiscal policy. This does not preclude deficits during downturns. But is does require that the primary budget is balanced over time, and that the public sector can give creditors a sufficient rate of return on their investments.

Finances can be brought under control either through tax hikes or expenditure cuts. Some countries have such high tax rates, however, that tax hikes might not raise more revenue. And governments that are economically able to gather more revenue might face an electorate that does not tolerate higher tax rates. Cutting expenditure is politically difficult too, and has short-term economic drawbacks. Hence getting one's fiscal house in order might well be a difficult task.

Preparation is key

Current yields on sovereign bonds in the US, the UK and Japan reflect a belief that politicians will sort things out and eventually put enough fiscal backing on the table. That might happen, and then inflation will behave congenially. Investors may swiftly come to a different conclusion, however. That would cause much higher inflation than we have experienced over the last three decades. Being prepared for such an eventuality is prudent when managing a bond portfolio.

New fund legislation benefits unit holders

The new securities funds act aims to strengthen the Norwegian fund industry's competitive edge and provide unit holders with more choice, greater influence and improved information.

The new act entered into force on 1 January 2012. SKAGEN expects that unit holders will benefit in a number of ways:

• Ability to compare key information

A new standardised document with key fund information will replace the simplified prospectus. The goal of this Key Investor Information Document (KIID) is to make it easier for investors to compare funds from different management companies. This two-page document describes the main fund characteristics along with the fund's goals, investment philosophy, historical returns and costs.

SKAGEN has been publishing a Key Investor Information Document pursuant to the new rules since August 2011, and all Norwegian fund management companies must replace the simplified prospectus with the new KIID from July 2012.

• Greater influence for unit holders

Unit holders shall elect at least one third of the members on the management company's board

WHAT IS UCITS?

UCITS stands for Undertakings in Collective Investments in Transferable Securities and refers to a set of EU directives which in principle allow securities funds to operate freely throughout the EU based on an approval from a member state. The UCITS directives have been implemented in Norwegian legislation and Norwegian funds satisfying the relevant requirements are therefore approved as UCITS funds.

The new securities funds act implements the most recent directive: UCITS IV. The goal of UCITS IV is to provide investors with more choice and improved information. When implementing the directive in Norwegian law, the authorities have taken the opportunity to adjust the current securities funds act to make the provisions more understandable. All the regulations stemming from the law have been consolidated into a single regulation. of directors. The new legislation provides unit holders with extended decision-making powers in connection with fund mergers and changes to a fund's articles of association.

The requirement stating that the Financial Supervisory Authority must consider whether a change in a fund's articles of association is in the unit holders' best interests has been repealed. Under the new law, unit holders themselves are given the power to decide what is in their best interests, while the Financial Supervisory Authority is to ensure that the management company has followed the procedural regulations and fulfilled the information requirements.

The unit holders' influence will be evident when new board members are elected to a management company's board of directors. The new law approves electronic voting, thus enabling involvement from a wider range of clients than those able to participate in person at electoral meetings. Unit holders shall also be called to vote on fund mergers and any material changes in a fund's articles of association.

Share classes

The new securities funds act allows for the

HARMONISED REGULATIONS

SKAGEN has established all its securities funds in Norway and exports them by using the UCITS pas-

sport. To provide the best service, communication and follow-up for our foreign clients we work closely with select distribution partners, for example securities firms, banks

and central securities depositories. When one of these entities is to be entered into the unit holders' register on behalf of an underlying client, it is termed nomine registration. The entity that wishes to be entered into the unit holders' register on behalf of the underlying client must be approved by the Financial Supervisory Authority.

SKAGEN is actively engaged in efforts to harmonise fund regulation across Europe. Through this work, SKAGEN aims to help provide the best possible infrastructure for clients, irrespective of their country of residence. establishment of share classes whereby a unit holder's rights depend on which share class the units are issued in.

Share classes can, for example, be used to differentiate between management fees, provide different denomination currencies and allow the investor to choose between dividendpaying and accumulating classes. The benefit of share classes is that they can be adapted to the needs of different client groups while allowing all investors to be exposed to the same underlying investments. SKAGEN will consider whether to establish share classes in the funds it manages.

• A passport to other markets

All SKAGEN's securities funds are Norwegian registered UCITS funds. The UCITS status works as a kind of passport in relation to foreign authorities. The funds may be marketed in the whole EU/EEA area after a simple notification to the relevant authority.

SKAGEN has approval to market its equity funds and some of its bond and money market funds in Iceland, Sweden, Finland, Denmark, Luxembourg, The Netherlands, the UK and Switzerland.

THE FSA'S ROLE

All Norwegian registered securities funds are subject to supervision by the Norwegian Financial Supervisory Authority (FSA). The FSA approves the establishment of new securities funds. The management company has regular reporting duties towards the FSA. The FSA can at any time request more information about the management company and its business, and can also perform on site inspections.

All management companies must enter into a depository agreement with a financial institution to ensure that the funds' assets are separated from the management company's assets, and to protect the unit holders' interests.

The depository shall exercise certain control functions regarding the management company's disposition of the securities fund's assets, but has no independent rights of disposition over the assets.

Operational Risk in SKAGEN

In asset management, risk comes in many forms and the starting point for generating a good risk culture is risk identification. At SKAGEN all known and suspected risks are identified, recorded and tracked to handle them in the best possible way.

Operational risk – the risk that an oversight, a poor or incomplete process, or even human error, might cause losses – is in particular focus across the financial services industry. This holds true both internally at SKAGEN and for the Board of SKAGEN AS, where unit holders are represented.

A coherent and layered approach

Operational risk can never be eliminated entirely. But a coherent and layered approach to risk management, as practised by SKAGEN, seeks to ensure that the most damaging and most likely risks simply do not occur. And scrutiny by experienced and qualified third parties should help to ensure that our approach to operational risk is as good as it can be.

Ultimately, however, risk prevention and risk mitigation is the task of each and every employee. We believe that well trained employees, possessed of a good risk culture, with the systems to back it all up, is the best guarantee of good operational risk control.

Owning the risk

All employees are responsible for the continuous monitoring, mitigation and follow-up of actions associated with identified risks. The application of appropriate controls, be they automated or human, are considered to assess the 'treated' risk.

In order to keep the best possible overview of operational risk, SKAGEN has chosen to use a software program called Easyrisk. In this program, each risk is assessed for impact, and probability - the 'raw' risk. All risks are also allocated an owner, who is usually a leader or key decision-maker.

In addition, the Business Support and Compliance department is responsible for followup, control and risk management across the company. The department works independently of SKAGEN's main reporting lines; reporting directly to the Board of SKAGEN AS.

Twice each year the Business Support and Compliance department leads a full assessment of all risks across the company in the internal

www.finanstilsynet.no/no/Artikkelarkiv/Brev/2011/Merknader---endelig-rapport-4/

control process. And SKAGEN's internal auditor must assess the conduct and efficacy of this internal control process. This assessment is presented yearly to SKAGEN's Board.

A basis in law

SKAGEN's focus on operational risk also has a basis in law. Having a Norwegian domicile demands a strong focus on risk management and internal control. The fund manager has to comply with internal control stipulation (regulation of 22.09.2008, no. 1080) which sets requirements as to how risk management shall be executed. And the stipulation for information technology (regulation 21.05.2003, no. 630) sets the requirements for business continuity planning, and for the backup and inbuilt redundancy of vital systems. These areas are all points of interest for FSA inspections of the firm that occur on a regular basis. The FSA had no significant remarks during the last of these, in March 2011 - a copy of their report on SKAGEN can be obtained from the FSA website* (in Norwegian).

Involvement of the Board

Each year an operational risk report is prepared internally and sent to SKAGEN's Board of Direc-

tors. The report focuses on the largest risks, in other words those risks that carry both the greatest impact and that are considered the most likely. Similarly, the internal auditor, Ernst & Young, presents their own report to the Board. Based on these reports, a suggestion is made as to the areas internal control should focus on the following year. A final decision is made by the Board which SKAGEN's Business Support and Compliance department then executes.

International standard - the ISA 402

In addition to the comprehensive and layered approach described, SKAGEN has chosen to be audited against an international standard, ISA 402. This standard is an auditor-to-auditor report that focuses on identifying and assessing the most important and critical activities in an organisation in the receipt of a third party internal auditor, such as SKAGEN.

The objective is to confirm the effectiveness of the risk-reducing measures implemented, and to identify potential nonconformity. SKAGEN's external auditor, Pricewaterhouse Coopers, is charged with submitting an annual statement pertaining to the ISA 402 standard. This report can be provided to any unit holder's auditors upon request.

Currency risk in SKAGEN's equity funds

Our equity funds invest in companies world-wide. Some clients in our funds seek to hedge certain foreign exchange exposure based on the listing currency of our underlying holdings. We argue that while this may be wise for bond funds, it is not for global equity funds.

Listing currency does not represent total currency exposure

There is a common fallacy that one can hedge FX risk in an equity fund in the same way as a bond fund by hedging the listing currencies of the underlying holdings. But the currency risk is only to a small extent identifiable and is a complicated function dependent on a number of direct and indirect factors for any company. It does not make sense to buy Siemens on the German rather than the American stock exchange just to avoid USD risk. In general, hedging on the listed currency only gives shortterm value in the event of a sudden change in exchange rates.

Currency hedging may increase currency risk!

Attempts to hedge unwanted FX exposure may boomerang badly. Say that American Inc. sells its products in Europe in euro, but produces them in the US, paying its costs in US dollars. If the dollar weakens against the euro, the share price immediately falls in euro terms. This is a short-term effect of the change in exchange rates. However, in the long term, we would expect profits to rise because costs (which are in dollars) fall.

If you prefer numbers to words, assume revenues are EUR 100 million to start with, and costs are USD 100 million, with a prevailing exchange rate of 70 eurocents to the dollar. With a 10% depreciation in the USD rate, the share price initially falls 10%. However, over time, we would expect costs, converted from USD to EUR terms to fall EUR 7 million, such that the profit rises from EUR 30 to 37 million. The short- and long-term effects of the change in the exchange rate counteract each other. Hedging out one of these currency risks (most likely the short-term one) would imply that you in fact upset the balance and paradoxically increase the risk.

Let the market do the work for you

In reality, it is impossible to hedge against all outcomes created by currency exchange movements. In the long run a free market will correct the short-term bias created by currencies. It would be beyond the scope of this article to discuss all the possible impacts of a change in exchange rate, but it is prevailing wisdom that, for example, a change in the value of the dollar may have an impact on the dollar oil price as well, which may be another component of a company's income/costs. It can also impact the company's funding position, if say, it has debt denominated in a foreign currency.

Currency risk in our funds

SKAGEN's global equity funds seek to balance all forms of risk, including currency risk in the most appropriate manner. Exposure to individual regions is kept proportional. The consis-

* The inception date for SKAGEN Global is 07/08/1997, while for SKAGEN Kon-Tiki it is 05/04/2002

Harald Haukås, Analyst at SKAGEN Funds.

tency arising from our approach can be seen in the table below. This illustrates the annualised return since inception for SKAGEN Global and SKAGEN Kon-Tiki in the major currencies we publish our funds' prices in.

The main deviant from the group is returns in CHF, but this is mainly because of the currency's role as a safe haven over the past few years.

SKAGEN Global and SKAGEN Kon-Tiki do not have much specific Norwegian kroner currency risk; most of the Norwegian companies they are invested in, such as Stolt-Nielsen and Seadrill, actually represent businesses with global exposure (shipping and oil services). SKAGEN Vekst carries some Norwegian kroner currency risk since over 50% of the fund is invested in Norwegian companies, some of which have very local operations.

To conclude, we would recommend that clients carefully consider the cost against the relative benefit of hedging any currency exposure in our equity funds, particularly in relation to their investment horizon.

Awards and Ratings in 2011

The consistent performance of SKAGEN's funds and managers was recognised in several of our market areas in 2011 in the form of awards and ratings.

Recognition in various market areas

The management company, SKAGEN AS, was recognised both in the UK and Denmark this year. In the UK, SKAGEN was named Nordic Asset manager of the year at the Financial News Awards 2011 ceremony, while in Denmark SKAGEN was named fund manager of the year by Morgenavisen Jyllands-Posten and Dansk Aktie Analyse. This is the third time that the newspaper Morgenavisen Jyllands-Posten and the independent research firm Dansk Aktie Analyse have ranked SKAGEN as number one, with previous victories in 2009 and 2007. In 2010 and 2008 SKAGEN was a highly ranked number two.

Meanwhile, in the Netherlands, the equity fund SKAGEN Global was elected best investment fund by the public at fund awards ceremony De Gouden Stier in November. This is the fourth year in a row that SKAGEN has been nominated and won awards at De Gouden Stier, which means the Golden Bull.

S&P - as all round

Standard & Poor's (S&P) review of equity funds, carried out this summer, again highlighted the strength and consistency of the portfolio management team. Though the three funds have differing ratings, they have all received at least one of those elusive As.

In its review of the emerging markets equity fund, SKAGEN Kon-Tiki, the rating agency S&P says that it continues to hold the team in very high regard and this, together with the fund's excellent long-term track record, means that the AAA rating is "easily retained". The fund is ranked number 16 of 607 emerging markets funds worldwide over the past five years. In evaluating the fund, S&P writes that "The fund's track record is one of the strongest and most consistent in our review... and [SKAGEN Kon-Tiki] is within the top 5% of the peer group over three and five years." The key to the continued long-term success of SKAGEN Kon-Tiki lies in its "adherence to an approach that is based on absolute valuations and in-depth company analysis," according to S&P.

The equity fund SKAGEN Global has retained its AA rating from S&P. The team managing SKAGEN Global has been working together since March 2010, when Kristian Falnes took over the reins. In its comment on the rating, S&P writes that "Fund changes under Falnes have been gradual and minimal, reflecting the consistency and discipline of the investment philosophy and process." The rating agency concludes that "The team, all of whom are generalists, has clearly settled well, working closely together with an effective collegial mentality" and says that in all SKAGEN Global "easily retains" its AA rating.

S&P assigned an A rating to equity fund SKAGEN Vekst a little over one year after Beate Bredesen took over as lead manager. "Our confidence in [Bredesen's] stockpicking and portfolio construction skills is sufficient for the fund to achieve an S&P A (New) rating," said S&P in its comment on the rating. The SKAGEN Vekst team was strengthened by Ole Søeberg in May 2011, and a new portfolio manager, Geir Tjetland, is set to join the team in January 2012.

SKAGEN recognised by Lipper

Between them, the equity funds SKAGEN Global and SKAGEN Kon-Tiki won a total of nine Lipper awards at the various ceremonies that took place around Europe in 2011, including in the Nordic countries, the Netherlands, at the European ceremony in Luxembourg and in the UK. SKAGEN Global was named best global equity fund in all the above-mentioned regions for its performance over the past ten years while SKAGEN Kon-Tiki was named best emerging markets equity fund for its performance over the past five years.

Quantitative and qualitative ratings

SKAGEN's funds have been assigned both quantitative and qualitative ratings by a number of ratings agencies including Morningstar, Citywire and Wassum. Quantitative ratings are based on a fund's return relative to its risk over a distinct number of years, while the qualitative ratings are assigned based on an analyst's opinion of a fund's relative investment merit. The table below gives a full overview of the ratings assigned to SKAGEN's funds, while additional information and reports can be found on SKAGEN's website, www.skagenfunds.com, under Ratings.

Sponsorship for the long term

SKAGEN donated a total of two million euro to various organisations in 2011.

SKAGEN has a long-term cooperation agreement with Kolibri - Children at Risk Foundation, SOS Children's Villages and Médecins sans Frontières. In 2011 SKAGEN donated around one million euro for projects carried out by its three cooperation partners.

"The work of these organisations is entirely different from our own. They work to improve conditions for the most impoverished children and young people in various parts of the world. For six years the work they do has generated the support and interest of our employees and clients," says Harald Espedal, managing director in SKAGEN.

In 2011 SKAGEN also donated a total of around one million euro to a new permanent exhibition at a local science museum in Sandnes, Norway.

Spreading their small wings

Children at Risk Foundation uses the humming bird ("kolibri" in Norwegian) as its name and symbol.

"Kolibri is a small organisation, but is big on inspiration, knowledge and wisdom. SKAGEN has discovered this and provided the little "bird" with the unique opportunity to lay several "KolibriEggs": Three art and activity centres for children and young people have been built since the cooperation began," says Sigve Fjeldtvedt, manager in Kolibri.

Safe home for children

SKAGEN's commitment to SOS Children's Villages has resulted in the financing of five family houses in the children's village in Pskov, Russia. This is where orphaned and vulnerable children are provided with a new family and a safe home. The children live with a safe care person, grow up with siblings and a sense of belonging which is crucial in creating a stable and good upbringing.

"It is almost impossible to express how valuable the contribution to SOS Children's Villages in Pskov is. It is a value that spreads beyond the individual children who are given a safe home, education and future opportunities. It is value creation for a whole community. SKAGEN's longterm cooperation ensures a good upbringing for the most vulnerable children," says Svein Grønnern, general secretary in SOS Children's Villages Norway.

Needs are great

"Médecins sans Frontières values its long partnership with SKAGEN and the company's contribution to helping people in extremely difficult situations," says Dag Horntvedt, general secretary in Médecins sans Frontières.

SKAGEN has sponsored life-saving work in

Africa with money earmarked for several different projects:

- Treatment of HIV/AIDS patients in Lesotho which is one of the world's poorest countries and where almost 25 percent of the population lives with HIV.
- Established local HIV centres with local authorities.
- Treatment of malnourished children in the Niger delta (via Médecins sans Frontières in Denmark).
- Strengthened local health services to improve general HIV care and in particular prevent mother-to-child transmission.

Sponsoring local knowledge

SKAGEN also donated a total of around one million euro to a new permanent exhibition at a local science museum in Sandnes, Norway.

At last we have the opportunity to develop new themes associated with the town's history in Sandnes and can pass on much of the history about industry and commerce in the region – which has, and still is, characterised by a great deal of value creation and founder mentality," says Målfrid Snørteland, director of the regional science centre, Jærmuseet.

to veto any potential investments which are not supportive of our investment philosophy, or which breach our ethical or corporate governance guidelines.

Shared ideas, individual decisions

Interaction within the portfolio team is mostly informal. The teams are all located around one desk in Stavanger and share ideas and communicate in a continuous and ad-hoc manner "across the table".

Although there is a common research platform, individual managers are responsible for

taking independent decisions for their fund. Portfolio managers are rewarded not only based on the excess returns and performance of the funds but also according to other criteria, such as commitment to the firm and their ability to share investment ideas. Many portfolio managers invest a considerable share of their personal wealth in their funds, thereby aligning their interests closely with those of the clients.

Our portfolio managers share a strong belief in SKAGEN's contrarian investment style - a long term approach that requires patience, dedication and thorough research.

Portfolio management is a team sport in SKAGEN. All portfolio managers share a strong belief in SKAGEN's applied value orientation, a contrarian and common sense based investment style that requires patience, dedication and thorough analysis.

Our experienced portfolio managers are generalists, good analysts and strong decision makers. The teams operate on a flat structure and everyone is required to contribute their own investment ideas. Each team does, however, have one lead portfolio manager with ultimate responsibility for the fund and thereby the right

Challenging headwinds

2011 was a very challenging year for SKAGEN Vekst which saw periods of strong headwinds. The fund's returns were far from satisfactory.

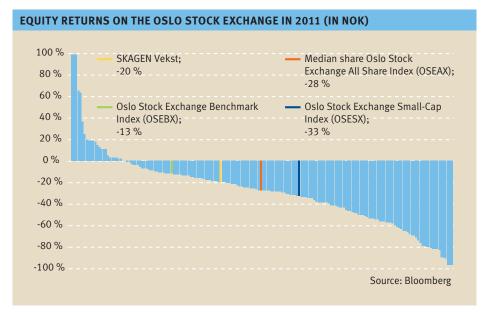

At the start of the year the larger Norwegian companies seemed close to fully valued while it appeared there was value to be found among the smaller companies listed on the Oslo Stock Exchange. In line with the SKAGEN investment philosophy we invested more in these undervalued and unpopular companies. With hindsight we can safely say that the year did not turn out as we had expected.

The reason for some of the headwind was the increasing focus on the economy throughout the year. As value-based investors, this was particularly frustrating for us, as it took focus away from the companies and their underlying development. It was particularly challenging to see nervous investors moving away from smaller companies and shifting over to the larger, more liquid companies on the Oslo Stock Exchange. This is evidenced by the fact that the median share price on the Oslo exchange lost 28 percent, while the Oslo Stock Exchange Benchmark Index fell 13 percent, measured in Norwegian kroner.

Oslo was not the only market that posed challenges for us last year; there were also large negative contributors among our non-

Norwegian investments. Common to the worst performing investments was the fact that earnings expectations were revised downwards during the year. As a result we saw already cheap companies became even cheaper, both in Norway and abroad.

Better days ahead

That said, the developments in 2011 also gave rise to opportunities. We believe that the focus will shift back to companies' fundamentals and as long as we continue to find companies with low valuations, the patient unit holder will be rewarded in the long-run. At the end of the year valuations were at such low levels that we witnessed increased merger and acquisitions activity.

Positive developments during the year included the acquisitions that took place. In our portfolio rig company Pride International, diagnostics company, Axis-Shield, and Gregoire, which makes wine harvesting equipment, were all taken over during the year. At the end of the year there were offers for farm equipment maker Kverneland and US retailer Winn-Dixie Stores. Three industrial companies showed interest in Kverneland and the completion of the offer is currently in process. We have already secured a profit for the fund and expect Kverneland to be taken over shortly.

The many wounds

Energy is the largest sector in SKAGEN Vekst, representing 22 percent of invested assets, and we were unfortunate with company selection within this sector in 2011.

In a stormy autumn market for supply ships, the sale of new shares in DOF turned out to be detrimental to the stock. A total of 56 percent of stock market valuation was shaved off and DOF thus became the fund's largest negative contributor in the year. We are positive about the company's future, however, as it has a very modern fleet with good exposure to Brazil and the North Sea. In light of the current estimates for oil investments and new rigs in coming years, we believe that the company will not only meet its debt obligations, but also make value for its shareholders. The company is currently valued at half its net asset value. DOF is not the only investment within the supply sector as about six percent of the fund is invested in oil supply, with the investments divided between a total of six companies.

SKAGEN Vekst's long-term twin investment in Bonheur and Ganger Rolf did not contribute positively either. Investor appetite for conglomerates declined noticeably, and coupled with poor liquidity, the discount to intrinsic value increased from 35 to 45 percent. Conversely, we were satisfied with the performance of Fred Olsen Energy during the year. Since this is the main component in the conglomerate, we believe we will eventually be rewarded for our patience.

Sevan Marine and Norwegian Energy Company (Noreco) were also large negative contributors in 2011. With the former we misjudged the company's ability to utilise the good rig market in the spring to raise more capital. The company instead ended up being fully restructured. First the drilling unit was spun off as Sevan Drilling and later Sevan Marine's remaining holding in this company was sold to Seadrill. At the end of the year the company appeared as new: they still have the technology, but the debt is gone. The industry is also coming to accept the new technology now that Teekay has taken over the company's floating production units.

In the case of Noreco, disruptions in production meant that cash-flow did not meet expectations. In addition, they have not been able to deliver positive exploration results. A large part of the board has been changed and new management is in place. Several of the assets have been sold, the costs have been trimmed and part of the debt has been renegotiated. This will all set the company on the right course for the future. It is now a company with an exciting exploration portfolio combined with a suitable cost and debt structure.

There were other positive contributors in the energy sector and we saw good returns from the seismic companies TGS Nopec, EMGS and Spectrum.

New entrants and exits

Our largest investment in 2011 was Sevan Drilling. Due to its historic tie to Sevan Marine the company is trading at a considerable discount. We believe that acceptance for the technology grew throughout last year, thanks to satisfactory operations for its current rig, Teekay's ties to Sevan Marine and, last but not least, the Seadrill ownership stake. The company has sensible financing and looks like a clear takeover candidate.

The fund also invested in Russian gas company Gazprom, which has been an investment in SKAGEN Kon-Tiki and SKAGEN Global for some time. We sold large parts of our holding in Farstad Shipping. In addition we exited the oil services and equipment company, Superior Energy.

Raw materials weak

The raw materials sector performed poorly both in the benchmark index and in SKAGEN Vekst. The prospect of slower global economic growth is quickly reflected in the price of commodities. The price of aluminium fell substantially in the

DOF has a very modern fleet with good exposure to Brazil and the North Sea, amongst other areas.

second half of the year as did the share price of Norsk Hydro, which is our largest holding in this sector.

Lights in the forest

Being invested in Norwegian pulp and paper company, Norske Skog, proved to be a roller coaster ride in 2011. We still await consolidation and a substantial reduction in capacity within the industry. The highlight was that the company managed to renegotiate parts of its debt at the same time as there was a decline in input costs. The next large repayment of debt is due in 2014 and the possibility of an equity issue in the next two years is therefore substantially reduced. Low valuation also sets the stage for potential upside if we are right. Due to its continued high risk, the stake only constitutes 0.4 percent of the fund.

SKAGEN Vekst's newest investments in the sector are biological fertiliser company Agrinos, paint and coatings maker, Akzo Nobel, and Turkish gold miner, Koza Altin. All three contributed positively in 2011. We exited the German seed producer, KWS Saat, and the Norwegian mining company, Northland Resources, at a profit.

The best performer in the industrial sector was Kverneland. We also had a formidable return on our holding in Golar LNG, which tripled in value in 2011 and was a winner on the Oslo Stock Exchange. Conversely, our holdings in Norwegian Air Shuttle and Dockwise proved disappointing. There is no surprise that the former performed poorly in a year when cyclical industries did not do well. With Dockwise the results were worse than expected. We expect to see an increase in transportation of large modules by sea in the next few years, which is why we have a holding in the company.

Adjusted earnings

SKAGEN Vekst's largest investment is Kongsberg Gruppen. A reduction in planned deliveries of weapons systems to the US military resulted in a decline in earnings expectations. We are still pleased with the defence and maritime division, and the company is delivering record margins. We are increasingly optimistic about the share price, not least because it is at its lowest valuation in a decade.

We added Norwegian Car Carriers to the portfolio in 2011. At the same time we trimmed our holding in chemicals shipping company, Stolt-Nielsen.

The consumer discretionary sector was the second worst performer in the portfolio in 2011. This was largely due to our investment in Carnival Cruise Lines which we added to the portfolio at the start of the year replacing Royal Caribbean Cruises. We lost less than we would have if we had stayed in RCCL, nevertheless, the year as a whole was not good for our cruise investments. It is noteworthy that it was not a drop in earnings, but rather the lack of growth, that disappointed the market and weighed on stock prices. The growth in the cruise fleet will be moderate in coming years at the same time as this type of vacation grows in popularity. We still believe that both companies are undervalued, but the pricing difference is again in favour of RCCL. We have therefore switched the majority of our cruise investments back to RCCL.

Tireless performance

In 2011 we exited the Korean tire maker Hankook Tires at close to all time high prices, and could thereby book a nice gain from this investment. We replaced this holding with its competitor Continental. Not only does this company have a low valuation, it also has new technologies for the car industry. We believe this technology has the potential to become a good contributor to earnings in the years to come.

Within the consumer staples sector the largest contributions came from relatively new investments, including supermarket chain Winn-Dixie. We also added the Danish brewery Royal Unibrew to the portfolio during the year.

The largest negative contributor in the sector was salmon processing company Morpol. In the first half of the year the company entered into a contract that was far larger than that which they had stated in their strategy. The timing of this contract also later proved to be highly unfavourable. In addition there have been rapid changes to the board and management. The fear is that the founder, main owner and Chief Executive Officer, who are the same person, does not have the best interests of minority shareholders in mind. We believe that the business model is still intact and that the company can rebuild investor trust. For now we are keeping a close eye on Morpol and are ready to act if there are renewed reasons to fear for the value of our holding.

We also added to our holding in Finnish retailer Kesko and reduced the stake in salmon farming company Cermaq. In addition, we have almost exited the Chinese meat producer, People's Food.

In need of medicine

The healthcare sector was the second performer in the fund in 2011. Axis-Shield was bought by Alere and the cancer treatment companies Clavis Pharma and Algeta were also good contributors. Conversely, Teva Pharma, our largest holding, and Karolinska Development did not perform so well. We have exited Pfizer and also sold several smaller Korean pharmaceutical companies after good gains.

Banking and finance has suffered a lot in recent years. It is therefore pleasing to say that we are satisfied with our holdings within this sector. Gjensidige Forsikring was the fund's second best contributor, and also the largest holding within this sector. We are not as happy with our holding in Danske Bank, where we invested too early and ahead of the stabilizing of earnings.

In the spring we participated in a share issue by Aareal Bank of Germany. We subsequently sold the shares, in addition to a large part of our

US supermarket chain Winn-Dixie made just a fleeting visit to the portfolio. A bid was made for the company towards the end of the year.

original holding, with good gains. We also performed a timely exit from Rezidor Hotel Group and Norwegian Property in the spring; both markedly fell in the second half.

Old friends delivered

One should not ignore old friends, even in a year full of perils. Information Technology was the best sector in the fund. Our long-term holding in Samsung Electronics, which is SKAGEN Vekst's largest in the sector, impressed us with its sale of smartphones. Proact IT Group, which makes digital storage solutions, also provided a good contribution to the fund returns in 2011.

A new investment in this sector was Corning, which is a leading maker of glass for the IT and telecommunications industry. We are particularly optimistic about the company's sales of gorilla glass, which is extremely thin and durable, and used predominantly in smartphones. The company is the market leader in this segment and the early competition will first catch up in 2013/14. We exited Seagate Technology, which in a little more than a year, has provided good returns.

In aggregate the telecommunications sector provided a small negative return in 2011. The main parts of our Russian telephone company, Sistema, developed well. This is in stark contrast to the stock price. Over several years, SKAGEN Vekst has had good contributions from this holding and we realize that we will have to be patient. In France Telecom, the basis for our investment, specifically low valuation, low earnings expectations and high dividends, were not enough to bolster the share price. The stake was reduced towards the end of the year. We completely exited Total Access Communications (dtac), where we were able to book a nice gain.

In the utilities sector our main holding has been Eletrobras, which also has provided good returns for several years. In 2011, the Brazilian electricity company did not contribute positively. We increased our holding in the company during an equity issue during the spring.

More concentration

For more than a year we have worked on making the portfolio more concentrated and we therefore continued to reduce the number of holdings. This exercise has not gone as quickly as planned because of share price considerations. We still want to reduce the number of holdings and increase the liquidity in the portfolio. The results of this work will become apparent over time.

Even though the value-focused SKAGEN investment philosophy did not yield the desired results in SKAGEN Vekst in 2011, we are still of the opinion that the companies' ability to create value will again become the focus of investors. It will hence also increasingly be reflected in share prices. When this change in focus will come is still not known but it is with increased optimism and low company valuations that we cast off into a new year for SKAGEN Vekst. The aim of SKAGEN Vekst is to achieve the best possible risk adjusted returns through an actively managed portfolio of Norwegian and international equities.

This combination allows the fund to take part in value creation in sectors that are not available on the Norwegian market. The fund's aim is to find high quality companies at a low price, which are characterised by being undervalued, under-researched and unpopular.

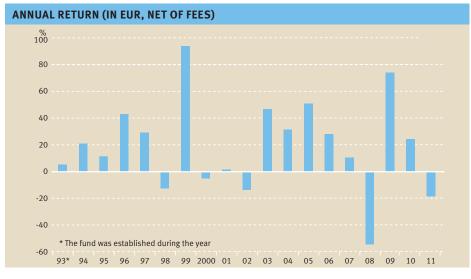

SKAGEN Vekst is suitable for investors who want a well balanced fund with a broad mandate, which gives large scope for diversification both geographically and across industries.

A year characterised by macroeconomic data and fear is not the best climate for an active manager like SKAGEN. The year did not end too badly, however.

A year characterised by macroeconomic data and fear is not the best climate for an active manager like SKAGEN. We cannot claim to be satisfied with the fund's performance in 2011.

The return for unit holders in SKAGEN Global was minus 6 percent, while the fund's benchmark index was down 4.3 percent, measured in euro. This makes 2011 the second year that SKAGEN Global has been beaten by the world index since its inception in 1997. The previous time the fund underperformed was in the financial crisis year of 2008, when we paid the price for our relatively high exposure to emerging markets.

Unit holders, who have been with SKAGEN Global since the fund first saw the light of day 14 years ago, can still take pleasure in an average annual return of 15.5 percent. During the same period, those who invested in the world index would have received an average annual return of 1.2 percent.

Greek demonstrates took to the streets several times last year. The theatrical behaviour of US politicians when it came to raising the country's debt ceiling in August and a renewed focus on the debt problems in Europe sent global investors flocking to safe havens in 2011.

Resemblance to 2008

2011 was characterised by significant fluctuations in the capital markets. During the first half of the year we experienced rising stock markets and commodity prices, while the US dollar and general risk premiums fell. This development culminated during the summer and was turned on its head in the second half of the year.

The theatrical behaviour of US politicians when it came to raising the country's debt ceiling in August and a renewed focus on the debt problems in Europe sent global investors flocking to safe havens.

Sovereign debt in countries like the US, Japan and Switzerland, along with gold, turned out to be popular among investors. Meanwhile, risky assets such as equities, corporate bonds, emerging market currencies and commodities became unpopular, as they were when risk aversion reigned in the autumn of 2008. The difference this time around was that the fluctuations in price were not as extreme, either on the upside or the downside.

As was also the case in 2008, stocks in emerging markets performed worse than those in developed markets; with the BRIC countries being particularly weak. Turkey, where the fund has an overweight compared to its benchmark index, was also one of the weakest stock markets last year.

Among the larger stock markets, the US topped the list, as it also did in 2008. The broad S&P 500 stock market index actually gained three percent, measured in euro.

Compared with the benchmark, SKAGEN Global has a larger proportion of holdings in emerging markets and is underweight US equities. At the end of the year, the fund had 32 percent invested in both markets. By way of comparison, the index had 13 percent in emerging markets and 46 percent in the US stock market.

2008 demonstrated that we are susceptible to poor relative performance during periods

where investors flee – in our opinion, irrationally – to so-called safe havens in the US, Japan and Switzerland. This time around we had a better geographical balance in the fund, which helped us to tackle a period of increased risk aversion relatively better than we were able to in 2008.

Oil up – oil services down

In a year in which there has been a great deal of uncertainty concerning developments in the world economy, the oil price ended the year up 12 percent and the share prices of the majority of the larger oil service companies were up. Investors raised their required rate of return during the autumn, however, so the share prices of most oil service companies were down at the end of 2011. Our oil service sector return was minus 10 percent in line with the performance of the US oil service index.

In connection with Pride International's acquisition by its competitor Ensco, we sold a large proportion of our shares, making the US rig company the best contributor in the sector. Following major operational problems and the value-destroying acquisition of Aker Drilling and subsequent share issue, we decided to sell most of our shares in Norwegian drilling company, Transocean, at a loss.

We more than doubled our position in Gazprom. Austrian oil company, OMV, and US oil services company, Weatherford, were newcomers in the portfolio.

Poor commodities

Having lost 26 percent during the year, commodities were the fund's worst performing sector. Falling commodity prices combined with a poor economic outlook meant that South American steel company, Ternium, German cement producer, HeidelbergCement, and Norwegian aluminium and renewable energy company, Norsk Hydro, experienced a relatively large share price drop.

We sold out of German seed company, KWS Saat, and more than doubled our position in Akzo Nobel, the Dutch coatings company.

Having acquired Georgia Pacific's European business, Sweden's SCA has become Europe's market leader in paper-based hygiene products. If investors become more aware of SCA's substantial forestry property and improving profit margins, the share price should continue to develop positively in 2012. The fund's other commodity companies are positioned for continued good growth in emerging markets.

Tyco up on split

The industrials sector was down 11 percent. American Tyco International was the best performer in the sector. The decision to split the

The acquisition of the Italian dairy giant Parmalat meant that the company was the best contributor to the fund in 2011.

business into three separately listed companies pushed up the share price considerably. Based on an individual valuation of the three units, we believe there is the potential for a further positive revaluation of the company in 2012.

LG Corp experienced a negative share price development, largely due to exceptionally poor results from its associated company LG Electronics. Temporary staff agency Randstad was, along with the rest of the industry, affected by the weak economic outlook.

Trimmed down Renault

The value development of the fund's investments within the consumer discretionary sector was more or less in line with the fund's return. Weak results within the mobile phone division meant that LG Electronics was the loser in terms of share price performance. US cable TV company Comcast was the best contributor to the sector and the company performed better than most of its competitors.

We more than halved our position in Renault after the company's share price rose substantially once it had sold the majority of its Volvo shares. The fear of weak car sales in Europe meant that the Renault share price later fell considerably, however, so we used the opportunity to add to our position in the French car maker.

Based on the stock value of Nissan, in which Renault has a 43.3 percent stake, Renault's share price indicates that the company's core activity has a negative value. We believe this is far too pessimistic. Not least in light of the company's attractive market positions and significant sales growth in several emerging market countries.

Italian dairy profit

With a value increase of 30 percent, consumer staples was the fund's best performing sector. This was primarily due to the sale of our shares in Italian dairy company Parmalat to Groupe Lactalis of France. As a result of this acquisition, Parmalat was the best contributor in the fund in 2011.

Unilever and Tesco were newcomers to the portfolio in 2011. We believe their respective positions in emerging markets will contribute most towards future growth; Unilever already gets more than 50 percent of its turnover from emerging market economies.

Good health – at last

Last year's losing sector, pharmaceuticals, got a welcome lift and the fund's pharmaceutical shares rose 25 percent during 2011. Extremely low pricing at the start of the year attracted an increasing number of investors to both Pfizer and Roche. As the difference between the share price and our fundamental price target narrowed significantly, we chose to reduce our position in the former.

The world's largest manufacturer of generic drugs, Teva Pharmaceutical (Teva), and German hospital operator, Rhoen Klinikum, were newcomers to the portfolio.

The Teva share price has come down sig-

nificantly as a result of Teva losing its patent on its most important drug, Copaxone, from 2014. The valuation of the company's generic business is now very low.

Rhoen Klinikum has also lost much of its popularity among investors due to the fact that since its capital increase in 2009, the company has not made any significant new investments. We are sympathetic to the company's view that it is important to be disciplined with acquisitions. We believe there will be several profitable opportunities in the privatisation process of German hospitals in the next few years and in the meantime we can take pleasure in the fact that the existing hospital portfolio is currently cheap.

US banks

Our financial sector exposure resulted in losses for SKAGEN Global as it did for the global stock markets in 2011. We ended up losing 25 percent in share price terms, mainly in our US holdings of Citigroup, Goldman Sachs and Bank of America. During the year Bank of America was taken out of the portfolio and Goldman Sachs brought in.

We are still of the opinion that our US banks are fundamentally cheap. Citigroup, for example, is priced at around half its book value, adjusted for intangible assets (goodwill, etc.). A scaling down of the bad business in Citi Holding and profitable growth within consumer financing in several emerging market countries may create good dividend opportunities for the years ahead. We therefore doubled our position in Citigroup during the course of the year, partly financed by the sale of shares in Japanese investment bank Mizuho.

We have avoided exposure to European banks. The difference between the banking sectors in Europe and the US is vast. In the wake of the 2008 financial crisis, US banks implemented large loan loss provisions and were supplied with a substantial amount of new equity. We have not seen a similar cleansing process in Europe. Consequently, US banks currently seem much healthier and better capitalised than their European counterparts.

Although we must admit that our entry into US banks was premature, we have high hopes that the wheat will be sorted from the chaff and that there will be great potential for revaluation in 2012.

The bright spot in the sector was Norwegian general insurance company Gjensidige, whose positive earnings development made it a share price winner on the Oslo Stock Exchange.

Accenture satisfied – Kyocera disappointed

Viewed as a whole, our technology investments

ended up in positive territory, but only just. The best contributor was consultancy firm, Accenture. After a period of strong earnings and share price development, we sold our entire stake in the company.

The share price performance of our old Japanese acquaintance, Kyocera, disappointed. Weaker markets for ceramic components for the electronics industry led to the company adjusting its earnings outlook downwards for the year. Kyocera has significant assets outside its core activity. Adjusted for these, its core business is now priced relative to current earnings on record-low multiples.

Samsung Electronics continues to deliver good results. In 2011 smart phones and tablets were its largest contributor. The fund's preference shares are priced at just over six times expected earnings in 2012, and in line with book equity. Since the company has a great ability to grow organically, there are few intangible assets on the balance sheet.

Samsung's management has also shown strength through innovation and short but profitable product cycles within electronic components and consumer electronics. The combination of low valuation and operational competence is a good argument for keeping the company as the fund's largest investment.

Oracle and Yahoo!

New investments within the technology sector were US software manufacturer Oracle and internet company Yahoo!.

Based on expected growth, the price tag for Oracle seems low. The company also has a more robust business model than most of its competitors, and should be able to handle weaker economic conditions without a substantial weakening of its profit. Yahoo! is a fallen internet star, which has long been under heavy share price pressure. If one takes a moderate view of the valuation of Yahoo's stockholdings in Yahoo Japan and Chinese Alibaba Group as one's basis, the core activity seems extremely cheap. There is a great deal to indicate that the value of the above-mentioned stockholdings will become visible in the course of 2012.

Out of Thai telecoms success

Within telecommunications, Thai Total Access Communication (dtac) was up a full 113 percent, and takes credit for the sector's returns of 12 percent. Extremely good profit performance, a shareholder-friendly dividend policy and a sensible capital structure has made dtac increasingly popular. We reduced the position gradually throughout the year, and the final sale was made in December in conjunction with dtac giving a large one-off dividend to shareholders. Following a period of good share price development, Indian Bharti Airtel was sold out of the portfolio. It was replaced by French telecom and media company, Vivendi, which is priced at a large discount to its intrinsic value. Increased competition in the French mobile phone market has curbed investors' enthusiasm for Vivendi. A low price relative to earnings, a dividend yield of nine percent and a possible change in the conglomerate structure could act as a catalyst for the share price going forward. We also doubled our stake in Vimpelcom, and added to our position in China Mobile.

Within utilities, Calpine was sold out at a good profit. The Brazilian state-dominated electricity company Eletrobras, which fell 13 percent in value in 2011, is now our sole investment in the sector. In the short-term the way in which the Brazilian state handles power concessions that are due to be renewed will be central to the Eletrobras share price development. We believe the current share price indicates that expectations are low. Concession renewals therefore may represent a great potential for revaluation of the shares.

Major challenges

As we enter 2012, the world economy faces major challenges. Economic growth in Europe appears as though it may turn negative, in the first half of the year at least. In the US, low but positive growth is expected.

The big question is how emerging markets will develop. Although there is a lot to indicate reduced growth there too, it is realistic to believe that growth will be maintained at a level that will not tip the world economy into a global recession, as was the case at the end of 2008/beginning of 2009.

Although the valuation of the SKAGEN Global portfolio is not as attractive as it was at the start of 2009, the pricing is low relative to the value creation we anticipate going forward. The fund's ten largest holdings are on average valued at 8.3 times expected earnings in 2011, and only 90 percent of book equity.

Despite the relatively gloomy outlook for the world economy, we believe there is good reason to count on growth in companies' earnings next year also. This will, in turn, cause the price/earnings ratio of the companies in our portfolio to fall further. It is also worth noting that the direct yield from companies' dividends is currently considerably higher than the yield from government bonds.

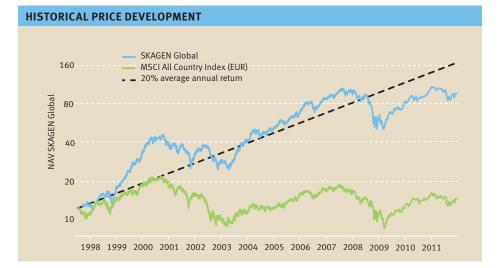

A shift in mood from fear to greater optimism and belief in the future could lift share prices substantially. Whether the mood change will take place in 2012, however, is hard to say. We are ready regardless. SKAGEN Global has a worldwide investment mandate. The fund's aim is to find high quality companies at a low price, which are characterised by being undervalued, under-researched and unpopular. To reduce risk, the fund seeks to maintain a sensible geographical and sector balance.

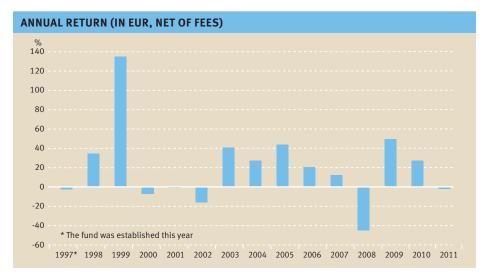

SKAGEN Global is suitable for investors who wish to spread investments worldwide and achieve diversification, both geographically and across industries.

Badly paid for good ideas

This year investors once again fled emerging markets and were paid poorly for good investment ideas. There is, however, comfort to be had from the fact that companies in the portfolio are almost as cheap as they were at the bottom of the market in the autumn of 2008. And this is after a period in which the fund price doubled.

In the first and fourth quarters of 2011 stock markets were relatively calm and SKAGEN Kon-Tiki achieved a good risk-adjusted return. In the second and third quarters, however, investors' risk appetite fluctuated considerably so we experienced a risk-on/risk-off environment in the stock market. In the latter period, the fund's return was weak, in both absolute and relative terms.

For the year as a whole, the fund delivered a negative return of 13.3 percent measured in euro; a result that we are not satisfied with.

The emerging markets index was down 15.7 percent over the same period.

Indiscriminate sale

The autumn flight from emerging markets meant that large, liquid companies were the hardest hit. And as was the case in 2008, we did not get any downside protection from owning low-valued preference shares, which are less liquid but have priority for dividends. The indiscriminate sale by investors to secure badly needed cash meant that preference shares had a harder time of it than ordinary shares.

We were particularly disappointed by the poor compensation we received for, what we considered to be, some excellent ideas and extremely thorough investment processes. This was, to a large extent, due to the correlation between asset classes, countries, sectors – and not least companies – which is normal during times of great uncertainty.

Although the fund's share price performance was weak, the underlying performance of companies in the portfolio was on the whole good.

Challenges were not unexpected

2011 was dominated by macroeconomic challenges. As a result of rising commodity prices and strong economic growth in the first half of the year, inflation in several emerging markets countries became perilously high. A combination of authorities' cooling down measures and bad news globally resulted in inflation subsiding in the second half of the year.

Despite clear signs of weaker growth in developed markets, it was not until the end of the year that authorities demonstrated any willingness to implement stimulatory measures, cutting interest rates and banks' reserve requirements in a number of countries. In the second half of the year investors and analysts lowered companies' earnings forecasts, not because of lower economic growth, but rather due to fear of falling margins as a result of cost pressures.

Emerging markets' currencies fell heavily on the back of the flight to perceived safe havens, while many companies have become more competitive. When the fear among investors starts to abate, there is reason to believe that several currencies will again strengthen. The currency weakening in some countries may be of a more lasting nature, however, owing to fundamental conditions. India is one such example, where both the political and economic infrastructure is poor.

Emerging markets suffered somewhat from risk premiums on sovereign debt, but the impact was minor compared to the eurozone. This reflects the fact that most countries are in control of central government finances as well as their external balance of payments. Inflation also seems to be under control. Moreover, companies do not appear to be suffering from financing problems, as was the case three years ago.

Liquidity through acquisition

Several companies in SKAGEN Kon-Tiki were the subject of acquisitions, mainly in the first quarter, and this provided for good liquidity throughout the year; we took our time re-investing the proceeds. As a result of continued lower pricing, we further increased the concentration of large companies (measured in market capitalisation) in the portfolio. The number of companies in the portfolio was therefore cut back, although we admittedly added a number of new, smaller, attractively priced companies to the portfolio at the end of the year.

The proportion of companies listed in developed markets fell somewhat. This is due to a combination of higher relative pricing and the fact that most of the acquisitions involved companies listed in developed markets.

Won on Pride

The energy sector was the fund's relative winner but a moderate loser in absolute terms. The takeover of Pride International by US oil-rig company Ensco early in the year must take most of the credit for this.

We added to our positions in Petrobras and Gazprom substantially. Both companies have large, unique reserves, and in a world of high oil prices it is surprising that their price tags are not higher. The share prices of both companies fell substantially on the back of investors' scepticism over their corporate governance.

The mystery of the year was the weak development of the oil service sector. Most companies experienced good performance in terms of operations and profit so the fall in share prices must be due to the general scepticism around equities as an asset class.

We swapped our position in Golar LNG Energy with one in gas shipping company, Golar LNG. We both bought and sold shares in North Atlantic Drilling, while we disposed of our entire holding in coal company Indo Tambangraya.

A newcomer to the portfolio is Siem Offshore, which has a new and modern fleet of anchor handling tug supply vessels. Based on the ships' market value, the company is priced at a discount of almost 50 percent. We expect a somewhat better market for the company's vessels in 2012, while there may be structural changes within this fragmented shipping segment.

The Chinese saved weak commodities

Commodities was a loss-making sector, but provided the fund with an extremely good relative return. The out-performance here also was down to takeovers; we made a solid profit from the sale of our position in copper producer Equinox Minerals to Barrick Gold in April, following a bidding war with Chinese Minmetals Resources.

All our shares in First Quantum Minerals, Aquarius Platinum, Norske Skog and Northland Resources were sold during the course of the year. We bought a position in Suzano Papel E Celulose, but later sold it again following a revaluation of the market situation and financial challenges faced by the company.

Within mineral sands and coal, we bought South African Exxaro Resources. Structurally high demand should bode well for its results going forward. There are restructuring plans for Exxaro Resources in 2012, which should generate more interest from investors. In addition,

SKAGEN Kon-Tiki increased its holding of gas shipping company Golar LNG.

higher prices for mineral sands and coal will improve earnings.

Awaiting a lift in Norwegian

Industrials was the weakest performing sector in the global emerging markets, but provided an acceptable relative return for SKAGEN Kon-Tiki.

Of the losers, construction companies Aveng and Empresa ICA stand out, as well as the manufacturer of power plant equipment, Harbin Electric. The losses made by these companies were only partly compensated for by the profit generated by European construction company, Strabag. Last year saw a weakening in expectations of public investments as a counter cyclical measure and at the end of the year the above-mentioned loss-making shares were trading at record-low valuations.

Airline companies AirAsia and Norwegian performed very well in terms of operations. We were rewarded by a share price increase in AirAsia, which was revalued last year and we believe the same will happen with Norwegian in 2012.

Substantial shipping loss

It was a tough year in the shipping industry. We made a significant loss on Denmark's AP Møller-Maersk and Nordic American Tankers. The extreme scarcity of natural gas meant that rates for Golar LNG were very good, making the liquefied natural gas company a great contributor to the fund's performance.

An amazingly large number of newly built ships were absorbed by the respective markets in 2011 and the surplus of ships for delivery from shipyards is gradually decreasing.

The economic drought made it particularly difficult to finance ships and this will enable

shipping companies with strong financial muscle to make good structural transactions going forward. One such participant will be John Fredriksen and we therefore bought into Golden Ocean and Frontline 2012, where Fredriksen is the majority owner. The purchases were partly financed by halving our AP Møller Maersk position.

We added to our holding in South African Bidvest whose global food service division alone is worth more than the stock value of the entire company. Our shares in Freeworld Coating were sold in connection with a takeover and our holding in Kumho Industrial was also sold out of the portfolio.

Full throttle

The consumer discretionary sector performed well, both in absolute and relative terms. Our car manufacturers, Hyundai Motors, Great Wall Motor and Mahindra & Mahindra – which also produces tractors – were all positive contributors. In emerging markets car manufacturing is a growth industry and all three companies have good potential globally.

Malaysia's automotive companies DRB-HICOM and Proton continue to deliver good returns for the fund.

The main loser in the sector was Korean LG Electronics. The company has not mastered the transition to smart phones, but the shares have now come down to a price relative to earnings level that we have not seen in the past decade. As a result of the extremely depressed market for Chinese consumer shares we gave in to the temptation at the end of the year to buy shares in Swiss watch retailer, Hengdeli, and shopping mall developer, Renhe Commercial Holdings.

Consumer staples was the winning sector in

global emerging markets and most of our companies also did extremely well. The exception was seafood company, Marine Harvest, which we have now exited completely, and Turkish Yazicilar Holding, the parent company of Efes Breweries. A newcomer to the portfolio was Dutch brewery, Heineken N.V. Investors do not appear to fully appreciate the company's market leading position in Asia.

Poor Hungarian health

In a year dominated by fear, defensive stocks such as health and pharmaceuticals tended to do relatively well, although this was not the case for our shares in the sector. Following a substantial share price drop for Hungary's Richter Gedeon, we added to our position in the pharmaceuticals company. A central trigger that could push the share price back up is if the company provides visibility over the values in its research portfolio. Another trigger is the free-falling exchange rate, prompted by Hungary's steady march towards an economic quagmire.

Following a steady fall in the share price throughout 2011, we bought back 'our' shares in China Shineway Pharmaceutical.

Weak finances

It was a very weak year for financials, the largest sector in emerging markets. The knock-on effect from the debt crisis in the eurozone and a tight credit policy in several emerging markets created problems with financing, and increased the risk of substantial loan losses. On the whole we stayed away from difficult areas such as Chinese banks and insurance but entered State Bank of India, albeit prematurely.

Turkey's Sabanci Holding and Bank Asya, as well as Egypt's EFG Hermes, had a particularly weak year. We cannot find any good company-specific reasons for the substantial drop in share prices.

We sold off our holdings in AFP Provida, Aksigorta, MBK Development, Polaris Securities and Kim Eng, the latter two as a result of takeovers.

We participated in the partial privatisation of VTB Bank in Russia, thereby increasing our shareholding significantly. This has cost us dearly so far. It is the first major Russian privatization for a decade and we naturally expect to see new and better corporate governance than is usual in Russian government-dominated companies. The bank's fundamental situation is now considerably better than it was three years ago, although the share price has not reacted significantly.

State Bank of India operates in an underdeveloped market for banking services. The transition from state bank to private sector has been slow, but last year's change of management gives us hope for improvement. A partial recapitalisation of the bank could trigger a share price upturn. The bank is priced in line with the first purchase we made in 2003. We exited the bank in 2007, and bought it back again in the spring of 2011.

We are pleased to see that Banrisul, Standard Chartered and Aberdeen Asset Management continue to perform well, both in terms of share price and operations. We substantially increased our position in the latter. Norwegian insurance company, Gjensidige Forsikring, was a good contributor. We trimmed our position throughout the year in line with the good share price performance.

Sour apples

Information technology was a relatively good sector in emerging markets. Our main investment for many years, Samsung Electronics, once again proved itself good at adapting. The company is turning out to be one of two global market leaders, primarily within distributed data processing. Although there has been an upwards revaluation of the shares throughout the year, the share price as well as the fund's position in Samsung Electronics is justifiable.

We added to our position in Taiwanese Hon Hai Precision Industry, the primary supplier of Apple. The fund has suffered a substantial loss on the investment. It appears as though the company's poor profit performance has turned around with rising operating margins and better return on capital.

Hon Hai Precision Industry has altered its business model from being personnel-heavy to more capital-intensive and increasingly expensive Chinese labour is to be replaced by robots. The company is trading at historic lows, and we believe that a turnaround operation will produce visible results in 2012.

Japanese mobile and Chinese internet

The telecommunication sector in SKAGEN Kon-Tiki consists largely of mobile phone companies. Our investments in this sector performed well thanks to the greater penetration of new technology and better appreciation of the mobile phone companies we own.

A newcomer to the portfolio was Japan's leading mobile telephony company, Softbank. The company is also a central player in Yahoo's bet on the internet in China, although a management change in Yahoo has created uncertainty about future performance. We continue to see a significant upside in its Chinese assets, at the same time as the telephone company is generating strong cash flow.

Our position in South Africa-based multinational media company, Naspers, was increased. The company is a leading internet provider in global emerging markets with a footprint in all parts of the world. The listings of Russia's largest internet company, Mail.ru, and Chinese internet service provider, Tencent Holdings, were a success. We expect the value of assets in Africa, Latin America, Eastern Europe and Facebook to become more visible in the near future.

After two good years, the share price of Russian conglomerate, Sistema, had a setback. The two most important assets, telecommunication and oil company, Bashneft, performed well, however, and the debt level in the parent company is now extremely low. We see signs of better corporate governance and assets appear to be being used productively. The discount to the underlying assets is again at near recordhigh levels.

China Mobile, Bharti Airtel and Indosat performed in line with expectations, but provided different investment returns. After a substantial revaluation, we sold our holding in Thailand's Total Access Communication (dtac), which has provided us with extremely good returns since we first bought the shares in 2002.

Within utilities, the state-owned Brazilian power company, Eletrobras, continues to be our sole investment. The company contributed relatively positively to the fund's return, as it did in 2010. Eletrobras has first rate assets but continues to struggle with corporate governance. 2012 should provide an answer to relieve the uncertainty related to the renewal of power concessions. A freer market for electricity should have an even more positive effect on Eletrobras in 2012 than it did in 2011.

A significant upgrade of the power sector in central countries such as India and China should make the potential within the industry even greater in future. We are set to take advantage of any opportunity that should arise.

Cautious optimism

At the start of 2012, there are still grounds for cautious optimism. We have not been badly affected by permanent loss of capital and the fall in share prices in 2011 should rather be considered a temporary price correction owing to global macroeconomic concerns.

The European Central Bank (ECB) has ensured that liquidity in the banking system is intact and the impact on global trade should be less severe than feared. Meanwhile the weakening of the euro has made European trade and commerce more competitive, which is important for internal balance in the eurozone.

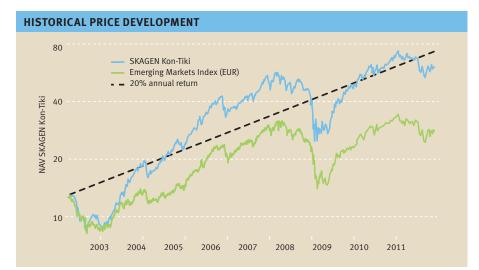

The investment choices we made in 2011 have improved the quality of the portfolio. And although the fund price has doubled since the last trough in the autumn of 2008, the pricing of companies in the portfolio is almost as attractive. The discount to the general emerging market is higher than ever.

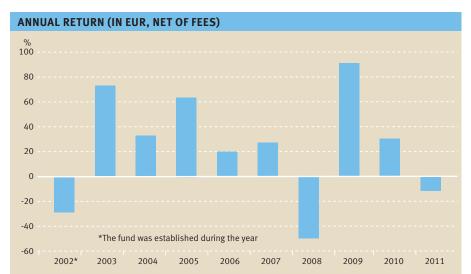

A word of comfort to unit holders in SKAGEN Kon-Tiki: Share prices may well fluctuate more than companies' profits, but value always wins in the end. SKAGEN Kon-Tiki has an international investment mandate, but is required to invest at least 50 percent of the fund's assets in emerging markets, meaning countries or markets that are not included in the MSCI Developed Market Series. The fund's aim is to find high quality companies at a low price, which are characterised by being undervalued, under-researched and unpopular. To reduce risk, the fund seeks to maintain a sensible geographical and sector balance.

SKAGEN Kon-Tiki is suitable for investors who wish to take part in value creation in emerging markets. The fund provides opportunities for exceptional returns through investments in areas with great growth potential. However, the risk is somewhat higher than in a global fund that invests mainly in developed markets.

Missed opportunities

At the start of 2011 we expected continued improvement in economic activity with gradually increasing bond yields. The Japanese earthquake and euro crisis triggered a flight to safety which sent bond yields plummeting to record lows.

The bond fund SKAGEN Avkastning delivered a return of 3.3 percent in 2011 against a return of 6.8 percent for the benchmark index, measured in euro.

Why did SKAGEN Avkastning end up so far behind the benchmark index in 2011? The main explanation is that we chose to have low duration in Norway. We did not predict that government bond yields in Norway would fall to the record low levels they did in 2011, and had therefore invested the Norwegian part of the portfolio in bank securities with floating interest rates. From April until the end of December, the yield on Norwegian government bonds with three years' maturity fell from 3 percent to 1.5 percent. Since the fund was not invested in securities with such long duration, we did not reap the rewards of this fall in interest rates.

At the start of 2011 we thought that increased growth in industrialised countries and higher inflation in emerging economies would lead to increased long interest rates globally. We adjusted the portfolio and reduced the duration substantially in the first few months of 2011. At times we also had very little or no foreign exposure.

Meanwhile, the global economy was exposed to several shocks, including the tsunami in Japan. From April growth expectations fell dramatically, as did long interest rates, which caught us off guard. Developments in the euro area, particularly Greece, were far worse than we had anticipated at the start of the year. We were quick to sell the fund's Greek government bond before the situation deteriorated and in so doing avoided significant losses.

From May we again increased our foreign exposure and duration. Since September the foreign exposure has been around 20 percent of the fund, which is about the normal level. November was a poor month for the fund as mounting uncertainty about the euro partnership caused higher credit premiums both for the government bonds in the fund and Norwegian bank securities. The fund's absolute return was better in the second half of the year than the second, while the relative return was poorer. Credit premiums on Norwegian bank securities with a maturity of over 12 months fell at the start of the year but rose substantially again in the second half. The rise was due to the knock-on effect of an extremely difficult financing market for European banks as a result of the euro crisis. By the end of December, bank securities in the fund's portfolio had an even maturity of three years. We will get capital gains on the bank securities when the credit premiums narrow as maturity approaches. The weighted credit duration for the bank securities in the fund is 1.5 years.

Greatest opportunities in emerging markets

At the start of 2012 there are numerous opportunities in the bond market. The major risk is the euro crisis. We think it is most likely that a solution to the crisis in the euro area will be forthcoming in 2012 which will be sufficient to calm the market.

If the uncertainty surrounding the euro abates, this could lead to higher interest rates in solid industrialised countries as a result of expectations of higher growth and a normalisation of credit premiums, amongst other things.

We believe that the opportunities for capital gains are greatest in emerging markets with a solid framework for fiscal and monetary policy and think that growth and/or inflation will come down most in several of these countries.

Furthermore, the euro crisis has substantially pushed up credit premiums on bonds in countries perceived as more risky. We expect risk premiums, inflation expectations and growth prospects to come down, which will lead to a drop in the long interest rates.

What about Norway?

Norwegian government bond yields plummeted to record lows in 2011 but we do not believe that the extremely low levels will last. Norwegian long-term interest rates will gradually rise along with the interest rates in other solid industrialised countries.

In December Norway's central bank cut the interest rate by 50 basis points to 1.75 percent

and the market is pricing in further cuts in 2012. The return on the Norwegian part of SKAGEN Avkastning depends on the money market rate, which is still high as a result of high risk premiums in the interbank market. How the money market rate develops will depend on what the Norwegian central bank does with the policy rate and what happens with credit premiums. These in turn depend on developments in the eurozone and will probably pull in opposite directions.

How have we adapted the portfolio to this market view? We have invested in certain foreign bonds in emerging economies and Eastern European countries where we believe interest rates will fall in 2012. We believe that the interest rates will fall as a result of lower real rates, lower inflation expectations and a drop in credit premiums. The Norwegian part of the portfolio is invested in bank securities with floating interest rates. It will in any case be important to monitor and analyse market developments and be willing to change direction if we see that investment conditions are shifting.

The Norwegian part of the portfolio is invested in bank securities and deposits in solid banks. A continued high money market rate and high credit premiums on bank securities are providing a good yield on these investments. At the same time there are possibilities for capital gains if a solution is found to the euro crisis and if risk premiums in the interbank market and credit spreads on bank securities come down.

Expectations in 2012

At the start of the year the yield in the fund is 3.7 percent. We also expect excess return as a result of capital gains on government bonds. On the basis of this, we target an annual return of around 4.0 percent for the next two years. Unit holders should, however, note that the fund price will fluctuate and that the return may be both low and negative in periods, as was the case in 2011. The reason for the volatility is interest rate changes in the international credit markets.

SKAGEN Avkastning

Active interest rate management

Homecoming fishermen. 1879. Detail. By Frits Thaulow, one of the Skagen painters. The picture is owned by the Skagens Museum

The objective for SKAGEN Avkastning is to provide its unit holders with the best possible risk adjusted return in the fixed income market over a six month period. This is achieved by balancing investments between fixed securities with short and long maturities and by investing in fixed income securities internationally. The fund has a worldwide investment mandate, but primarily invests in notes and bonds issued in Norwegian kroner. The fund only invests in issues with a low credit risk, i.e. government bonds, government guaranteed loans, loans to financial institutions and bank deposits.

SKAGEN Avkastning is a good alternative for investors who do not wish to commit resources to monitoring the interest rate markets and moving investments between interest bearing securities with different maturities.

Missing out on a bond rally

SKAGEN Tellus had a deplorable 2011, with the fund's net asset value down 0.7 percent measured in euro versus a 7.8 percent gain for the benchmark index. Why did our fund underperform?

The fund's duration in advanced economies was rather long during the first half of 2011 but we significantly cut the duration, i.e. we swapped long-term bonds for short-term bills, in the middle of the year. At around the same time, soft data started ticking in which was considerably worse than we had expected, especially for the US. While the hard data did not fully reflect the soft data, long-term interest rates plunged, both in the US and in many other advanced economies. This fall in long-term interest rates pushed bond prices up and led to a surge in the benchmark index.

In addition to a more uncertain outlook in the US, the eurozone sovereign debt crisis escalated, precipitating the flight of Asian money into Japan, North American money into Treasuries and European money into German bonds. Such safe-haven trades, as we last saw in 2008 can have a remarkably strong impact, and they left our fund on the sidelines. We also lost out on our emerging market exposure, due to higher long-term interest rates and somewhat weaker currencies relative to the euro – the fund's benchmark currency.

Will 2012 be a repeat of 2011?

We believe that investors have become too downbeat on the economic outlook. The most recent data points to continued growth in the US and the UK, and while the eurozone as a whole probably entered a mild recession in the fourth quarter of 2011, the latest indicators predict growth from the first quarter of 2012 for the eurozone as a whole. Some of the peripheral eurozone countries will still struggle in 2012, however Germany and some of the other northern eurozone member states seem geared for growth.

In the major emerging markets, indicators are slightly more ambiguous. While the last batch of indicators has on the whole surprised on the upside, the speed of growth in the Chinese economy, in particular, is more uncertain than was previously the case. Nevertheless, our base scenario is that the global economy will do better than most people expect this year. If this turns out to be the case, then long-term interest rates in advanced economies will rise, both due to a higher real rate of return on capital investments and due to the prospect of an eventual end to near-zero interest rate policies.

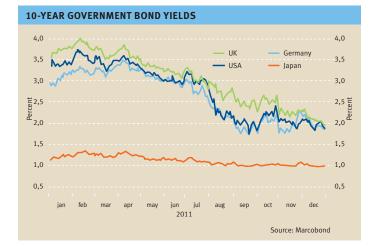

SKAGEN Tellus therefore continues to hold low duration investments in advanced economies, while we have positioned the fund at the long end of the yield curve in some emerging markets. When deciding which emerging market countries to invest in, a crucial criterion is that the fiscal stance is sound, i.e. that public debt-to-nominal-GDP ratios are low and stable.

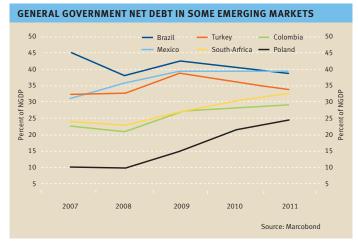

Prepared for the worst

Things could of course turn out quite differently from what we envisage. And hard-won experience should help us turn the fund around if a different scenario is about to materialize.

Downside risks are mainly connected to the outlook for the Chinese economy and, in particular, the sovereign debt crisis in the eurozone. A worst case scenario for the eurozone would be if one or more member states seceded or were expelled from the common currency. This would have the potential to trigger a new financial crisis and a deep global recession.

We believe the likelihood of a member state actually leaving the eurozone to be low,

however, since it is extremely difficult to foresee a scenario whereby the gain from dropping the euro exceeds the cost. Take Greece as an example. It is a commonly held view that if the drachma were reintroduced and allowed to fall in value relative to the euro, the Greek economy could get a boost through cheaper export and more expensive import. However, this reasoning builds on the assumption that price levels in Greece would not adapt to a free-falling currency and reduced wage rates. A phone call between the leaders of the two big private and public sector labour unions would be enough to trigger a demand for a compensating sharp rise in wages. The Greek price level would subsequently rise rapidly and adjust to a falling currency value, eliminating any gains to the real exchange rate.

If cool heads prevail there will be no breakup of the eurozone. The eurozone could be viewed as a polygamous marriage that never should have taken place, but given the high divorce costs, it is difficult to envisage a situation terrible enough to cause one, some or all of the member states to actually depart.

The ECB (European Central Bank) is doing a lot more to keep the eurozone afloat than it is given credit for. By lending an unlimited amount of money to banks for up to three years, it helps to alleviate bank's liquidity problems. Also, by giving banks a strong incentive to buy short- to medium-term sovereign debt, the ECB liquefies sovereign bond markets. It is often argued that the ECB should adopt the Federal Reserve and the Bank of England's quantitative easing policies, whereby these central banks buy sovereign debt in the secondary market. The ECB already does this; it just prefers to perform quantitative easing via the banks.

Since the inception of SKAGEN Tellus in September 2006 we have delivered an average annual return of 5.6 percent per year to our unit holders. That is one percentage point less than the benchmark index, and a result that we are far from satisfied with. For 2012 we have set ourselves the goal of closing the gap between the fund and the benchmark index and providing our unit holders with a return that is at least in line with the fund's historical average.

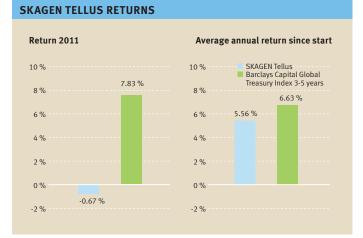

SKAGEN Tellus

A doorway to global interest rates

Interior. Brøndum's annex. Ca. 1920. Detail. By Anna Ancher, one of the Skagen painters. The picture is owned by the Skagens Museum

SKAGEN Tellus is a global fixed income fund that aims to provide investors with excess returns through investments in the fixed income market worldwide. The fund invests mainly in government bonds and certificates. The fund's aim is to provide its unit holders with good risk adjusted returns through an actively managed portfolio. SKAGEN Tellus has a risk profile between national fixed income funds and global equity funds.

SKAGEN Tellus is suitable for investors who wish to invest in global bonds and who have an investment horizon of at least 12 months. Investors must be able to tolerate currency exchange rate fluctuations. The fund is well suited as part of a long-term investment portfolio, both for individuals, companies and institutions. The fund takes currency risk and its benchmark currency is the euro.

GOOD RESULTS ARE NO GUARANTEE FOR FUTURE RETURNS

Historical returns are no guarantee for future returns. Future returns will depend, inter alia, on market developments, the fund manager's skill, the fund's risk profile and management fees. The return may become negative as a result of negative price developments.

Explanation of concepts

All calculations of measurements are based on monthly observations.

Traditional risk and performance measurements

Standard deviation is a measure of the variation of annual returns. There is approximately a 65 percent probability that annual returns will be in the range of plus/minus one standard deviation. The probability that returns will deviate more than two standard deviations from the expected return is approximately five percent. A high standard deviation may indicate high risk.

The Sharpe Index measures the probability of the fund generating a higher return than the risk-free interest rate. The higher the score, the higher the probability. The higher the probability, the more certain are the chances of achieving excess returns in the equity market. Thus, the value may be used as a long-term measure of risk, but is often used as an absolute measure of risk-adjusted returns.

Relative volatility is the standard deviation of the annual excess return relative to the benchmark during the relevant period. Relative volatility measures the manager's ability to create regular excess returns relative to the benchmark, but is often used as a measure of a fund's independence of the benchmark.

Information Ratio measures the probability of the fund generating a higher return than its benchmark. The higher the score, the higher the probability of achieving excess returns. The information ratio is also used as a measure of riskadjusted excess returns, where risk is construed as the chance of uneven excess returns. Thus, the information ratio measures the manager's ability to create certain excess returns, whereas relative volatility measures the ability to generate regular excess return.

Alpha is a risk-adjusted measure of the so-called active return on an investment. It is the return in excess of the compensation for the risk borne, and thus commonly used to assess active managers' performance. It can be shown that in an efficient market, the expected value of the alpha coefficient is zero. Therefore the alpha coefficient indicates how an investment has performed after accounting for the risk it involved

An alpha value less than zero means the investment has provided too little return relative to the given risk (or had too high a risk in terms of yield).

An alpha value of zero means the investment has earned a return adequate for the risk taken. An alpha value of over zero means the investment has a return in excess of the reward for the assumed risk.

Beta of a stock or portfolio is a number describing the relation of its returns with that of the financial market as a whole. An asset with a beta of 0 means that its price is not at all correlated with the market. A positive beta means that the asset generally follows the market. A negative beta shows that the asset inversely follows the market, if the market goes up, then the asset generally decreases in value and vice versa. Instead of the market in general SKAGEN applies the fund's reference index.

R2 is used in the context of statistical models whose main purpose is the prediction of future outcomes on the basis of other related information. It is the proportion of variability in a data set that is accounted for by the statistical model. It provides a measure of how well future outcomes are likely to be predicted by the model. A high value (close to 100%) indicates a high and good explanatory power.

Correlation is a measure of relationship between a set of two variables or measurements. A high correlation means that one set of variables can be predicted from the other and vice versa. In this case a high correlation (close to 100%) means that the asset or portfolio follows the market closely.

Value at Risk (VaR) is a widely used risk measure of the risk of loss on a specific portfolio of financial assets. VaR here corresponds to how much you can risk losing in a month with 2.5% probability. Calculations are both parametric and observed figures from the past five years. Given that the observations of the last five years are among the worst in the last 30 years, it is expected that the calculation based on these observations shows a greater loss potential than the parametric calculation (based on standard deviation).

The relative VaR is a measure of the worst under performance in a month

Profit and loss analysis

Relative gain/relative loss is a measure of the ability to achieve excess returns in cyclical upturns and downturns, respectively. A relative loss of 80 percent means that the fund has suffered a loss corresponding to the loss it would have suffered if it were invested 80 percent in the benchmark and 20 percent in risk-free securities.

A relative loss of less than 100 percent means that the fund is losing less than the market in a cyclical downturn. A relative gain of more than 100 percent means that the fund is performing better than the market in a cyclical upturn. If you compare with a fund's standard deviation, these measures may explain why the standard deviation is higher or lower than the benchmark.

Relative gain/relative loss ratio shows the ratio between relative gain and relative loss. A value above one means that the fund is getting better paid for the risk assumed relative to the benchmark. When ranking funds investing in the same market, the measure is strongly correlated with the Sharpe Index, but also shows whether the risk-adjusted return is better than the risk-adjusted return of the market. Thus, the measure may be used to compare funds in different markets, as opposed to the Sharpe Index, which may only be used to compare funds investing in the same market.

Positive/negative index divergence shows positive or negative annual divergence during the relevant period. If positive divergences are greater than the negative ones, the fund has achieved a higher return than the benchmark. The total of positive and negative divergences is a measure of the fund's independence from the benchmark.

Index divergence ratio shows the ratio between positive and negative benchmark divergences. This is a measure of the ability to create excess returns. The higher the number, the better you get paid for each negative benchmark divergence. The benchmark divergence ratio interprets risk as the chance of negative index divergences, as opposed to the Information Ratio, which construes the risk as irregular excess returns (not necessarily negative excess returns).

THE ELECTION COMMITTEE

The election committee consists of Sigve Erland (Chair), Martin Petersson and Mette Lundh Håkestad. The election committee proposes candidates for unit holder representatives for the Board of Directors of SKAGEN AS.

A turbulent year

2011 was a year dominated by major world events; an unstable global economy, natural disasters, political unrest in North Africa, the accident at the Japanese nuclear power plant Fukushima 1 and the European sovereign debt crisis. The financial markets were influenced by the macroeconomic shifts, and we have seldom seen such high correlation between individual share prices and the macroeconomic mood as in 2011. The essence of SKAGEN's investment philosophy which focuses on the development of individual companies, was therefore not in vogue this year. Over time, however, we believe that share prices will come to reflect the underlying companies' value creation.

It was also a challenging year for SKAGEN's funds although several of SKAGEN's fixed income funds delivered positive returns. The Board is grateful for the confidence our clients have shown, reflected in net investments of NOK 601 million (EUR 79.4 million) in SKAGEN's funds during the year.

What happened in 2011?

Despite the tragic earthquake in Japan and unrest in North Africa, global equities were relatively stable throughout the first quarter. While 2010 saw record investments in the emerging markets, this trend was reversed in 2011 due to high commodity prices and increasing fears of inflation. A lot of the capital found its way back to the developed markets.

The development in the global economy was weaker than most people expected, and this influenced the second and third quarters of 2011. The Greek sovereign debt crisis re-emerged and resulted in renewed doubts in Europe. Cutbacks in China, high commodity prices, rising inflation and the decision not to use fiscal stimulus in the USA made for a high fear indicator that influenced the worlds' markets. American budget quarrels and sovereign debt that literally went through the ceiling added to the burden.

Despite the many dramatic incidents that took place throughout the year, the sovereign debt crisis had by far the strongest influence on the financial markets in 2011. The stock markets were not the only ones to experience turbulence, bond markets suffered too. Both the credit and interest rate risk were significant and bond yields fluctuated in line with global investors' mood swings.

Efforts to find a solution for the indebted European countries were stepped up during the autumn and by the beginning of December, 26 of 27 countries had agreed on a new framework for stricter budget discipline in the eurozone. A great many uncertain factors need to be resolved however, before the eurozone countries can be said to be home free.

There are a few rays of light in the financial markets. American and German key indicators are positive which may contribute to pleasant surprises next year. The fear of inflation in several emerging markets has been replaced by the fear of weak growth. Politicians in certain emerging markets have therefore started to actively use interest rates as a stimulus. The inflation problems in specific countries such as India have not been resolved, uncertainty plagues the Chinese banking system and there is political insecurity in Russia. These are all factors that will influence the financial markets in the year to come, in addition to the unresolved issues of European countries' and banks' debt.

There have been a few new additions to SKAGEN's portfolio department as well as some reorganisation. With a view to further cultivating his role as portfolio manager of SKAGEN Global, Kristian Falnes handed over his role as Investment director to Harald Espedal on 1 October. Harald Espedal is also Managing director. Ole Søeberg joined the SKAGEN Vekst team on 1 May and the team will be further strengthened by the arrival of Geir Tjetland in January 2012. The need for resources and expertise in SKA-GEN Kon-Tiki has grown in line with the size of the fund. Portfolio manager Ross Porter has therefore moved from SKAGEN Vekst to join the SKAGEN Kon-Tiki team.

What can we expect in 2012?

As mentioned above, 2011 was not a good year for stock pickers like SKAGEN. Macroeconomic themes governed the stock markets and most other financial markets. One of the greatest risks in emerging markets is linked to whether or not they are able to use interest rates to stem the flow of rising inflation. The danger of weak growth due to reduced demand from the West and low domestic demand will also be decisive. In the developed markets, a lot still depends on the sovereign debt crisis in Europe. The European Central Bank's initiatives – including issuing large loans to the European banks which they can use to purchase sovereign debt – are a step in the right direction.

SKAGEN's equity funds are valued at the same levels as during the 2008 / previous financial crisis and the risk premiums for shares are high, both in absolute terms and relative to bonds. Provided the macroeconomic outlook becomes clearer, our portfolio companies' underlying values may start to become reflected in their share prices. The fixed income funds, and especially the bond funds, are naturally influenced by the macro picture, and here a converging of bonds in developed and developing countries present opportunities.

Assets under management

SKAGEN's assets under management fell from NOK 110.3 billion (EUR 14.1 billion) to 98.8 billion (EUR 12.7 billion). Despite the turbulent markets, there were net subscriptions of NOK 601 million (EUR 79.4 million) in the funds.

Although there were net redemptions in Norway, SKAGEN has retained its position as the largest fund manager in the Norwegian mutual fund industry. The Swedish market also suffered net redemptions, whilst Denmark and the other international markets contributed to SKAGEN's total net subscriptions in 2011.

SKAGEN's markets outside Norway and Sweden have grown satisfactorily. The largest subscriptions came from unit holders in the Netherlands. Sweden experienced net redemptions due to large redemptions from the Swedish Pension Agency (PPM). In 2011 SKAGEN brought to the Swedish authorities' attention the fact that certain financial advisors were doing a great deal of asset churning, and highlighted the potential negative impact this could have on fund returns. The Board is pleased to note that the Swedish authorities established restrictions to prevent this practice with effect from 1 December 2011. Redemptions via PPM mainly reflect adjustments made by the financial advisors in anticipation of the new rules. Apart from this there has been stable growth in the business in Sweden.

The fixed income funds had net subscriptions of NOK 361 million (EUR 46 million) which came from all client segments except Norwegian bank distribution.

There were no unusually large redemptions in the equity or fixed income funds in 2011.

Returns in the funds

Many of SKAGEN's funds delivered a weak performance in 2011, both in absolute and relative terms.

Compared to its benchmark index, SKAGEN

BOARD OF DIRECTORS' REPORT

Martin Gjelsvik Chairman of the Board and owner

Tor Dagfinn Veen Board member and owner

Barbro Johansson Board member, elected by shareholders

Kon-Tiki performed adequately, although the absolute return was negative. The fund lost 13.8 percent (13.3%)* in value, while the emerging markets index lost 16.3 percent (15.7%). The fund's average annual return since inception is 17.8 percent (17.6%).

SKAGEN Global was down 6.6 percent (6%) against a negative return of 4.9 percent (4.3%) for the benchmark index. The fund's average annual return since inception is 15.1 percent (15.5%).

SKAGEN Vekst had a negative return of 19.9 percent (19.3%), while the reference index delivered a negative return of 8.8 percent (8.2%). The fund's exposure to what were considered attractively priced small and medium sized companies on the Oslo Stock Exchange did not pay off, and several of the fund's previous best international performers did not deliver the expected returns. The fund's average annual return since inception is 14.6 percent (15.1%).

SKAGEN Tellus had a weak year in both absolute and relative terms. The fund regretfully failed to capitalise on the opportunities that were to be found in long-term interest rates during the year. The fund was down 0.7 percent measured in euros while the reference index was up 7.8 percent.

SKAGEN Avkastning achieved a return of 2.7 percent (3.3%) against a return of 6.1 percent (6.8%) for the benchmark index.

Measured in Norwegian kroner, SKAGEN Høyrente achieved a return of 3.2 percent versus 2.9 percent for the average 3-month NIBOR and 2.7 percent for the benchmark index. SKAGEN Høyrente Institusjon achieved a return of 3.3 percent versus 2.4 percent for the benchmark index.

SKAGEN Krona returned 2.7 percent measured in Swedish kroner, versus 1.6 percent for the benchmark index.

Changes in regulations governing SKAGEN's activities

The new act on securities funds and accompanying regulation entered into force on 1 January 2012. Provisions regarding key investor information enter into force on 1 July 2012. The act both restates existing legal provisions and implements amendments to the governing law.

The background for the changes is a new UCITS (Undertakings for Collective Investment in Transferable Securities) directive, UCITS IV. UCITS IV largely builds on previous directives, but also contains new provisions aiming to increase efficiency in the fund management business and introduce a greater degree of flexibility in how funds can be organised and managed. The counterweights to this flexibility are new rules on independent controls of the fund management company's business. The goal is to strengthen the European fund industry's competitiveness and provide investors with a wider choice, while improving access to fund information. The act also contains amendments that are not taken directly from the UCITS directive, but are implemented to improve the operating conditions for Norwegian fund management companies and simplify the law.

SKAGEN has participated actively in the legislative process and is currently implementing the new rules, for completion at the beginning of 2012. SKAGEN began using the new key investor information document (KIID) for all funds in August 2011. The KIID embodies the new European rules for key information. The key information document aims to present standardised information about all funds and fund types, irrespective of management company, allowing the investor to compare funds from different managers. The KIID is a two-page document describing the fund's main characteristics in addition to its goal and investment philosophy, past performance, costs etc. The document is to replace the simplified prospectus.

New opportunities for clients

SKAGEN aims to provide clients with the best service, communication and follow-up, and wishes to be innovative and unique in its client service and communication.

A new and improved website was launched during the summer. In particular, the improvements provide for a better overview of fund prices, direct dialogue with SKAGEN's client advisors via a chat function (Norway only) and an improved news service that provides the opportunity for direct communication with SKAGEN's employees. The popular net meetings with the portfolio managers will continue in 2012.

Yuhong Jin Hermansen Board member, elected by unit holders

SKAGEN has also launched a new reporting platform, "My Page" that provides unit holders with tailored information, reports and analysis of their holdings.

To strengthen SKAGEN's presence in the Netherlands and service the growing client base, SKAGEN opened a new office in Amsterdam in the autumn. Due to increased interest and demand from Swiss clients, SKAGEN also obtained marketing approval in Switzerland in February 2011.

There has been a lot of activity in the other countries where SKAGEN's funds are marketed. The offices in Norway, Sweden and Demark have hosted inspiration meetings, lunch meetings and theme meetings, all with good attendance. In the UK, SKAGEN mainly has institutional clients. This client segment is often subject to strict regulations regarding asset management, and the employees in the London office have spent a lot of time with clients and their consultants explaining SKAGEN's investment philosophy, risk management and internal control processes. SKAGEN also invests a lot of time working with its distributors in different countries to ensure that they have sufficient knowledge about SKAGEN's funds and that the clients experience high quality service, also when investing via distributors.

Every year SKAGEN carries out a client survey in Norway and Sweden where we have the highest proportion of direct clients, to evaluate whether the company fulfils its goal of providing the best client service and follow-up. The 2011 client survey shows that, despite the performance of our funds, clients are still satisfied with SKAGEN.

SKAGEN's employees

At the end of 2011, SKAGEN has 167 employees divided between six offices in Norway (Stavanger, Trondheim, Ålesund, Bergen, Oslo and Tønsberg), two offices in Sweden (Stockholm and Gothenburg), one office each in Denmark (Copenhagen), the UK (London) and the Netherlands (Amsterdam). SKAGEN's funds are also marketed in Finland, Switzerland, Luxembourg and Iceland.

During its 17 years of business, SKAGEN has emphasised having an incentive structure

* Performance figures are given in Norwegian kroner while figures in brackets show euro figures

BOARD OF DIRECTORS' REPORT

Lars-Erik Forsgårdh Board member, elected by unit holders

and ownership model that encourages longterm planning and sustainable risk levels. The management company's earnings swing sharply with the markets and it has been essential to keep a low fixed cost base in order to sustain the organisation during hard times. This ideology is in line with the goals of the regulation regarding remuneration in financial institutions which entered into force on 1 January 2011, and SKAGEN has made the adjustments necessary to adhere to the regulation. In order to be able to recruit and keep the best employees in a global market, SKAGEN must be able to pay a variable income when the company shows strong results.

SKAGEN has a compensation model that is intended to encourage employees to work together to provide clients with the highest possible risk-adjusted returns. The model promotes cooperation between all departments to ensure that clients experience SKAGEN in the best possible way, also with respect to service, competent follow-up and communication. No employees have their salary directly tied to subscription results. Thus, we avoid the negative aspects often associated with such arrangements, including unhealthy internal competition and sales pressure, protection of own expertise and poor utilisation of employee resources.

Employee competency development is a priority for SKAGEN and our clients. At the end of 2011 nearly all of SKAGEN's client representatives are authorised financial advisors. The program has high requirements for theoretical and practical knowledge, and employees who deal with clients must sit examinations super-

Jesper Rangvid Deputy member, elected by unit holders

Anne Sophie K. Stensrud Deputy member and owner

vised by an independent committee. In Sweden a similar authorisation scheme was introduced in 2005, and all our Swedish advisors are authorised in accordance with it.

SKAGEN recruits employees with diverse backgrounds, and seeks to achieve a balance between male and female employees. At the end of the year, there were 59 female and 108 male employees. There are equal opportunities for both genders with respect to terms of employment and pay. In 2011, SKAGEN had an absence rate due to illness of 1.5 percent.

The Board of Directors wishes to thank all employees for a great effort in 2011. Employee competence and conduct are decisive to SKAGEN's performance.

Organisation

SKAGEN AS is supervised by the Financial Supervisory Authority of Norway, and is the manager for SKAGEN's funds. Handelsbanken is the funds' custodian and the Norwegian Central Securities Depository (VPS) is the registrar for SKAGEN's registry of unit holders.

Financial risk

The funds carry no financial risk, as they only have short-term debt connected with the settlement of securities.

Market risk, credit risk and liquidity risk

Risk in securities funds arise as a consequence of market movements, developments in currency, interest rates and the economic cycle as well as company specific issues. In 2011 the risk was within expected levels.

In addition to statutory requirements, SKAGEN sets internal requirements for industry balance and liquidity with respect to the securities in which the funds invest. These requirements have been met during the year. SKAGEN has also developed internal routines aimed at reducing the risk of errors that may affect the funds. The division of the equity portfolios' investments is a result of SKAGEN's investment philosophy, which includes requirements for company valuation, product/ market matrix, gearing and the liquidity of the security. The investments of the fixed income funds are made based on an evaluation of the creditworthiness of individual issuers and the general economic conditions in the country in which the issuer resides.

The Board confirms that the premise of the management company as a going concern continues to be fulfilled.

Investment philosophy

SKAGEN adheres to its investment philosophy and business concept. SKAGEN is convinced that the best way to create excess return for clients – currently as previously – is to have an active investment philosophy whereby portfolio managers seek unpopular, under-researched and undervalued companies. The same principles apply to the managers of SKAGEN's fixed income funds: the funds will be actively managed on the basis of our own analyses of the markets and the individual securities.

General notes

NOTE 1: ACCOUNTING PRINCIPLES

All figures in NOK 1,000 unless otherwise stated

Financial instruments:

All financial instruments, such as shares, bonds and certificates, are valued at fair value (market value).

Determination of fair value:

Securities are valued at market prices as of 30.12.2011.

Bonds and notes, for which there are no "marketmaker" prices, are at all times valued against the applicable yield curve.

Unlisted equities are valued according to the latest trading price, value adjustments made by brokers and internal valuations.

Currency exchange rates:

Securities and bank deposit/overdraft in foreign currency are valued at the prevailing exchange rate at the time of pricing 30.12.2011.

Treatment of transaction costs:

Transaction costs in the form of commission to brokers is charged to expenses at the time of the transaction.

Allocated to unitholders for reinvestment:

All distributions to unitholders in fixed income funds are treated as allocations of profit in accordance with the regulation for annual financial statements for securities funds.

Distributions from fixed income funds are accounted for by entering reinvestments as new units in the fund in the financial year.

Adjustment of acquisition cost:

For the equity funds, the average acquisition value has been used to arrive at the realised gain/loss on the sale.

For the fixed income funds, the FIFO principle has been used to calculate realised gain/loss on the sale.

NOTE 2: FINANCIAL DERIVATIVES

The funds have not held financial derivatives during the year.

NOTE 3: FINANCIAL MARKET RISK

The balance sheet in the annual financial statement for the funds reflects market value on the last stock market day of the year expressed in Norwegian kroner.

Through investment in Norwegian and foreign businesses, the equity funds are exposed to share price and currency exchange risks. The fixed income funds are exposed to interest and credit risks and to currency risks in those cases where the funds invest in other currencies than NOK.

NOTE 4: TAX CALCULATION Equity funds:

Equity funds are, in principle, exempt from tax on gains and do not have the right to deduct loss on realisation of equities when calculating taxable income.

Furthermore, dividends received from companies within the EEA are, in principle, tax-exempt. However, 3 % of realised gains from companies tax domiciled within the EEA and dividend received from the corresponding companies are treated as taxable to Norway.

Dividends received from companies outside the EEA are taxable. The funds may in addition be charged withholding tax on dividends received from all foreign companies.

The tax cost for the years 2011 and 2010 is associated with withholding tax on foreign dividends.

Fixed income funds:

The fixed income funds are taxable with 28% of net realised capital gain on interest-bearing securities, interest income accrued, currency gain/ loss, minus tax-deductible costs, which, amongst other things, include management fee. The taxable net profit is in principle distributed among unitholders so that the fund is in a non-taxpaying position.

NOTE 5: CUSTODIAN COST

The funds are only charged transaction related custodian costs.

NOTE 6: TURNOVER RATE

The turnover rate is measured by the size of the trading volume adjusted for subscriptions and redemptions of shares. The turnover rate is calculated as whichever is the smaller amount of either purchases and sales of securities in the portfolio during the year, divided by average assets undet managment during the year.

The funds' turnover rate for the year 2011 was: SKAGEN Vekst 23 %

SKAGEN Global	33 %
SKAGEN Kon Tiki	22 %
SKAGEN Avkastning	85 %
SKAGEN Høyrente	89 %
SKAGEN Høyrente Institusjon	92 %
SKAGEN Tellus	723 %
SKAGEN Krona	418 %

NOTE 7: SUBSCRIPTION FEE

No subscription or redemption fee.

NOTE 8:

Refer to pages 50 to 61

SKAGEN Vekst Note 9, 10 & 11

NOTE 9. MANAGEMENT FEE

The fixed management fee constitutes 1 % p.a. of daily asset under management in addition to the variable management fee: 1/10 of the return above 6 % p.a.

Portfolio key figures														

Yield Yieldto clients¹⁾

Duration²⁾

¹⁾ Yield adjusted for management fee.

 $^{\rm 21}$ Duration is a simplified expression of how much the price of the security will change if the interest rate changes by one percentage point.

³⁾ Yield is the average annual return of an interest bearing security until maturity.

⁴⁾ Securities are divided into six risk classes according to their credit risk. Class 1 has the lowest and class 6 the highest credit risk. Risk class 1: Supranational organisations

Risk class 2: Government, and government guaranteed within the EEA Risk class 3: Government, and government guaranteed outside the EEA Risk class 4: County and local government Risk class 5: Bank and financial institutions

Risk class 6: Industry

 $^{\rm s)}$ For liquidity in the portfolio as of 30.12.2011, please refer to the balance sheet.

All securities are traded in the Norwegian market.

Unit price as of 30.12.2011 104,1241

NOK 133.102.470,- is allocated for distribution to unitholders. This will result in a reduction in the unit price equal to the distribution per unit at the time of distribution.

SKAGEN Høyrente Institusjon

TOTAL SECURITIES PORTFOLIO ⁵⁾
--

Portfolio key fig	ures
Yield	
Yieldtoclients ¹⁾	
Duration ²⁾	

¹⁾ Yield adjusted for management fee.

²⁾ Duration is a simplified expression of how much the price of the security will change if the interest rate changes by one percentage point.

3,52% 3,37% 0,18

³⁾ Yield is the average annual return of an interest bearing security until maturity.

⁴⁾ Securities are divided into six risk classes according to their credit risk. Class 1 has the lowest and class 6 the highest credit risk. Risk class 1: Supranational organisations Risk class 2: Government, and government guaranteed within the EEA

Risk class 2: soverimient, and goverimment guaranteed within the EEA Risk class 3: coverimient, and goverimment Risk class 4: County and local goveriment Risk class 5: Bank and financial institutions Risk class 6: Industry

¹⁾ Yield adjusted formanagement fee.

²⁾ Duration is a simplified expression of how much the price of the $\mathcal L$, a simplified expression of how much the price of the security will change if the interest rate changes by one percentage point.

 $^{\scriptscriptstyle 3)}$ Yield is the average annual return of an interest bearing security until maturity.

1,87

⁴⁾ Securities are divided into six risk classes according to their credit risk. Class 1 has the lowest and class 6 the highest credit risk.

Risk class 1: Supranational organisations

Risk class 2: Government, and government guaranteed within the EEA Risk class 3: Government, and government guaranteed outside the EEA Risk class 4: County and local government Risk class 5: Bank and financial institutions Risk class 6: Industry

All securities are traded in the Norwegian market.

Unit price as of 30.12.2011 131,963

NOK 0,- is allocated for distribution to unitholders.

 $^{\rm 5)} For liquidity in the portfolio as of {\tt 31.12.2011}, please refer to the$ balance sheet.

Independent auditor's report

Report on the Financial Statements

We have audited the accompanying financial statements of the mutual funds, which comprise the balance sheets as at December 31, 2011, the income statements for the year then ended and a summary of significant accounting policies and other explanatory information. The income statements are showing the following results for the year ended at December 31, 2011:

SKAGEN Vekst	NOK	-1 972 527 077
SKAGEN Global	NOK	-2 466 613 579
SKAGEN Kon-Tiki	NOK	-6 693 487 924
SKAGEN Avkastning	NOK	33 669 197
SKAGEN Høyrente	NOK	123 549 507
SKAGEN Høyrente Institusjon	NOK	50 503 125
SKAGEN Tellus	NOK	-17 713 468
SKAGEN Krona	SEK	7 978 951

The Fund Management Company's Board of Directors Responsibility for the Financial Statements

The Fund Management Company's Board of Directors is responsible for the preparation and fair presentation of these financial statements in accordance with Norwegian accounting act and accounting standards and practices generally accepted in Norway, and for such internal control as The Board of Directors determines is necessary to enable the preparation of financial statements that are free from material misstatement, whether due to fraud or error.

Auditor's Responsibility

Our responsibility is to express an opinion on these financial statements based on our audit. We conducted our audit in accordance with laws, regulations, and auditing standards and practices generally accepted in Norway, including International Standards on Auditing. Those standards require that we comply with ethical requirements and plan and perform the audit to obtain reasonable assurance about whether the financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the financial statements. The procedures selected depend on the auditor's judgment, including the assessment of the risks of material misstatement of the financial statements, whether due to fraud or error. In making those risk assessments, the auditor considers internal control relevant to the entity's preparation and fair presentation of the financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of accounting estimates made by management, as well as evaluating the overall presentation of the financial statements.

PricewaterhouseCoopers AS, Kanalsletta 8, Postboks 8017, NO-4068 Stavanger T: 02316, www.pwc.no Org.no.: 987 009 713 MVA, Medlem av Den norske Revisorforening Independent auditor's report - 2011, page 2

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the financial statements are prepared in accordance with the law and regulations and give a true and fair view of the financial position of the mutual funds as at December 31, 2011, and its financial performance for the year then ended in accordance with the Norwegian accounting act and accounting standards and practices generally accepted in Norway.

Report on Other Legal and Regulatory Requirements

Opinion on the Board of Directors' report

Based on our audit of the financial statements as described above, it is our opinion that the information presented in the Board of Directors report concerning the financial statements and the going concern assumption, and the proposal for the allocation of the profit in each mutual fund is consistent with the financial statements and complies with the law and regulations.

Opinion on Registration and documentation

Based on our audit of the financial statements as described above, and control procedures we have considered necessary in accordance with the International Standard on Assurance Engagements ISAE 3000, "Assurance Engagements Other than Audits or Reviews of Historical Financial Information", it is our opinion that the Fund Management Company's management has fulfilled its duty to produce a proper and clearly set out registration and documentation of the mutual fund's accounting information in accordance with the law and bookkeeping standards and practices generally accepted in Norway.
